In our forecasts, the prices of agricultural products are likely to increase at a much lower rate than in 1994-95. The rate of increase is likely to be in the range of 9-10 per cent in 1995-96 and 1996-97 compared to about 13 per cent in 1994-95. Increase in the procurement prices of foodgrains has been of the order of 4 per cent in 1995-96 compared to an average of about 15 per cent during first half of 1990s. The stock of foodgrains with the government agencies is presently as high as 35 billion tonnes. While these factors would have a favourably depressing impact on prices of agricultural items, shortage of some critical items like pulses could have an opposite impact. Similarly the prices of manufactures are likely to increase at a lower rate in 1995-96 than in 1994-95 as the energy-mineral related administered prices are assumed to increase at a slower pace (7 per cent) than in the last few years (over 10 per cent). However, the international oil price situation could push up this rate. On balance, our forecast indicate an increase in the price of manufactures at the rate of about 9 and 8 per cent in 1995-96 and 1996-97 respectively in contrast to nearly 11 per cent in 1994-95.

III
Trade and Balance of Payments

Turning now to the external sector, we observe mixed signals. During the first quarter of this fiscal year (April through June 1995) export earnings have recorded an unprecedented 28 per cent increase in dollar terms over the corresponding period of last year. At the same time the import bill in dollars has also gone up by nearly 38 per cent. The fact that a good part of imports comprise of capital goods, industrial components and POL products has to be juxtaposed with favourable performance of the economy. Also, important to note is the fact that prices of POL products in the world have shown a significant upswing recently. Whereas these prices actually declined by a little over 4 per cent during 1994, they are likely to go up by 7 per cent in 1995 and by a little over 6 per cent in 1996. What is worse, there are indications that these prices will maintain an annual increase of 5 to 6 per cent till the early years of the next century (millennium) according to LINK forecasts. That this steady upward trend should occur when at long last India is witnessing a measure of economic recovery is not at all good news particularly as there is concern for domestic price stability.

The widening trade gap and its implications for the current account deficit has also to be seen along with the fact that India's external debt is steadily increasing towards the 100 billion dollars mark. During the four-year period beginning next year India is due for repayment of 24 billion dollars implying an average repayment of 6 billion dollars per year. With 3 to 5 billion dollar current account deficit in 1995-96 and 1996-97 and even larger deficit in the subsequent years, annual total payments burden could well be of the order of 10 billion dollars. In such a situation, the current foreign currency assets of the order of 19 billion dollars do not appear to be sufficiently comfortable.

Growth of exports at the rate of 28 per cent during the first quarter of 1995-96 is clearly out of line with 16 per cent growth as predicted by our model. 38 per cent increase in imports during the first three months of this year too is way above 20 per cent, the rate projected by us. Our forecast of trade gap of the order of about 5 billion dollar in 1995-96 would also stand revised upwards with all its forbidding consequences. While we have yet to watch the situation as it unfolds, it is quite likely that in the subsequent quarters, export and import growth may decelerate. 'By how much?', it is hard to foresee. One thing that is in any case clear is that over the next two to three years, growth of exports will remain about 15 per cent per [illegible] about 20 per cent per year - both in dollar terms.

In making the foregoing forecasts we are guided by a number of empirical judgments. First, we assume that the domestic production of crude will steadily increase from about 33 million barrels in 1994-95 to about 50 million barrels in 1999-2000. We also assume that the rate of import duties in aggregate will this year record a further decline by about 10 per cent and then stay unchanged. Similarly, export subsidies will this year decline further and then remain unchanged. World real income is perceived to grow by a little over 3 per cent per year over the next four years according to LINK forecast. We have also allowed for a moderate (approximately 2 to 3 per cent) depreciation of the rupee against the dollar. Recently exchange rate is hovering around Rs 32 per US dollar. However in mid-September 1995, rupee plunged close to Rs 34 against US dollar which some circles believe to be a temporary phenomenon. It is interesting to note that we assumed Rs 33 per dollar for 1995-96 in our March 1995 forecasts. We have now assumed Rs 32 per dollar for 1995-96 and Rs 33 for 1996-97. But, perhaps a larger measure of depreciation may become necessary to keep imports restrained and trade deficit in check. This, however, has

Notes: (i) g: Growth Rate in per cent
(ii) Figures in parentheses under Production and Capital Formation are Central Statistical Organisation's Provisional Estimates for 1993-94 and Advanced Estimates for 1994-95.
(iii) Figures in parentheses under Wholesale Price Indices for 1993-94 and 1994-95 are official figures.

implications for domestic price situation, exports and growth. There are trade-offs which will have to be appraised carefully.

Our estimates of exports, imports and trade deficit presented earlier are based on customs data (Directorate General of Commercial Intelligence and Statistics). These do not account for non-dutied and non-dutiable imports and lags between shipment of and receipts for exports. We have assumed 2 per cent and 3.5 per cent upward margin for exports and imports respectively to arrive at trade deficit according to balance of payments (BOP). These margins are in alignment with recent figures. Taking these margins into considerations, our estimates of trade deficit on BOP account turn out to be over 5 and 7 billion dollars for the years 1995-96 and 1996-97 respectively. These estimates are obviously higher than those based on customs data. Accounting for invisibles of the order of 2 4 and 2.8 billion dollars, current account deficit turns to be about 3 and 5 billion dollars in the years 1995-96 and 1996-97 respectively.

In this context we like to point out that trade deficit (customs) projected by us for 1994-95 is close to estimates provided in the just released Reserve Bank of India's (RBI) *Annual Report for 1994-95*, but trade deficit on BOP account is off by a wide margin. This is on account of larger margin (nearly 8 per cent) on imports (customs) and a lower margin (less than 2 per cent) on exports (customs) assumed by RBI for 1994-95. Consequently, the RBI estimate of trade deficit (BOP) is close to 4 billion dollars in 1994-95 in contrast to our estimate of 2.5 billion dollars. If this trend in the margins continues, trade deficit (BOP) for the subsequent years would also be larger. Another point to be noted in this context is that net invisible for 1994-95 according to RBI estimates is about 1.9 billion dollars. This is higher than our estimates of nearly one billion dollars. Consequently, our estimate of currant account deficit for 1994-95 is lower (close to 1.6 billion dollars) than the recent RBI estimate (about 2 billion dollars).

IV
Medium-Term Structural Ratios

It may be worthwhile now to turn briefly to the behaviour some of the 'great ratios' over the next few years. As proportion of gross domestic product at market prices, gross investment (total of using sectors) increases from 20.7 per cent in 1995-96 to about 22 2 per cent in 1999-2000. Government final consumption expenditure rises from 13 per cent to 14 per cent over the same period. Private final consumption expenditure moves very slowly from 76.5 per cent to 76.9 per cent. Exports (customs) increase from 9.0 to 10.5 per cent – for the first time in double digit since the late 1950s. But imports (customs) also record an increase from 10.4 to over 13 per cent. Trade deficit (BOP) rises from 1.6 to 2.8 per cent, whereas the current account deficit widens from less than 1 per cent to about 2 per cent. Public investment is likely to decline steadily from about 35.2 per cent to about 27.2 per cent as a share of total investment over the period.

As regards the structure of production, the share of agriculture in real GDP at factor costs declines steadily from 28 per cent to nearly 24.3 per cent. While the shares of manufacturing increases very slowly from 21.1 to 22.4 per cent, that of infrastructure remains more or less unchanged at 14.5 per cent. Services go up from 31 per cent to 33.6 per cent and public administration is more or less stay put at 5.4 per cent until 1997-98. Thereafter it begins to decline slowly but steadily.

(iv) Figures in parentheses for 1993-94 under balance of payments (BOP) are RBI's quick estimates (Annual Report, 1993-94).
(v) The mark-up of BOP exports and imports over DGCI and S are assumed to be about the same order as in the source cited in (iv).

Summing Up

As stated at the very beginning, our prognosis of the economy is not significantly different from what it was about six months back. This is because during this period there have been neither any significant policy initiatives nor any major exogenous shocks. Both the polity as well as the economy at present appear to chart a predictable course. Monsoon has been good once again. Fiscal imbalances and high monetary expansion persist. Exchange rate more or less stays put where it has been for the last two years. On structural adjustment programme front, policy-makers have not come up with anything new. The international economy too has remained more or less docile. A few things of either small importance or temporary effect are, however, worth recalling. The Enron deal is off at the moment but there are ample indications that it will be reviewed and perhaps restored. The increase in procurement and energ mineral related prices have been so far in the current year of a lower order than in the past.

In an overall assessment of the situation, continued tempo of industrial recovery, despite the prospects of a slow-down, is a matter of satisfaction. However, persistence of inflation for this and the next year, and widening fiscal and trade gaps are matters of concern. All the same the general mood of optimism continues to have an upper edge at the moment. The fact that election to the parliament due at the end of the fiscal year casts a shadow on the economy is already quite clear. This is manifest in terms of continued fiscal imbalance, inability of the government in taking any new and bold decisions, and more than all this, perceived uncertainty about the prospects of political stability.

UTTAR PRADESH

After Mathura: BJP's Emerging Strategy

Amaresh Mishra

The entire Mathura episode shows how much the political scene in Uttar Pradesh has changed since the Ayodhya days. The BJP had apparently hoped to consolidate and widen its constituency in the context of the break-up of the ruling alliance in the state and the dependence of the government in power on its support. This it has not been able to do.

THE deceptive calm which has descended upon UP in the immediate post-Mathura period is leaving some interesting trails. The BJP, of course, could not accomplish what it had intended. Nor did it suffer any major damage. On the contrary, its climbdown on the issue has brought it closer to Mayavati, despite the confrontation over the issue which seemed likely to revert the state back to the Ayodhya days. Indeed, the whole Mathura episode reflects how far UP politics has changed and that a revival of past events on the same basis is not going to occur. With Ayodhya no longer providing the necessary ammunition, Mathura and Varanasi were expected to be next on the Sangh parivar's list. For, in spite of shifting, the focus away from purely mandir-based politics, the BJP and the RSS appeared reluctant to give up attempts to exploit their potential. Thus the VHP's effort to whip up passions through the 'jalabhishek' in Varanasi and the 'mahayagna' at Mathura were not isolated attempts, without timing and backing. They were very much a part of the BJP's gameplan both to 'test' the waters and follow up its agenda. In the days to come, along with the following general issues, the BJP will continue experimenting with a host of mandir matters through different means and channels in keeping with the needs of the situation.

This time around, however, in both Varanasi and Mathura, especially in the former, the issue became more of a law and order problem rather than a 'political' one. Both its political build-up and follow-up remained poor: such issues can be said to gain credence when they are able to generate a 'new' controversy at the mass level, when some form of turbulence can be discerned at the level of civil society, independently of the 'hype'. All these features were distinctly absent from Varanasi where it became more of a VHP-Bajrang Dal cadre affair. The communal atmosphere could also not be pitched too high; the BJP apparently had hoped to consolidate and widen its constituency on its own plank in the context of the break-up of the alliance which had once provided a challenge to it, plus the presence of a government dependent wholly on its support. The ideal situation for the BJP would have been not so much a confrontation with the administration and renewed rise of a fear psychosis, but more, the raising of the communal temperature and a shift of issues to renewed polarisation around religious lines. This could have served the purpose of the BJP which in any case could not have been willing to precipitate a definitive crisis at this juncture.

But as things turned out, any communal polarisation reminiscent of the Ayodhya days could not take place. The Varanasi population remained sullenly indifferent at times, and even at Mathura which in any case has not seen any major communal disturbance for long, the unease was more over the fall-out of the issue in terms of security, etc, than because of a sense of political assertion over Krishna janambhoomi. The reaction of the Muslims too was muted and directed mainly against the state government, besides the BJP. Yet even though the BJP and its allies ultimately had to effect a climbdown, it was not a case of 'climbing down' against the state government led by Mayavati. During the event, the BJP and Mayavati supposedly stood at a stand-off with the chief minister adopting a hard administrative stand on the issue of allowing the VHP yagna at the original site. But here too as elsewhere it was not a simple case of diverging interests and perceptions of the two main alliance partners. For both the BJP and the BSP, the issue and the controversy was not without its merits; for the latter in particular, the Mathura episode came at quite a convenient time. Of late the rating of the BSP had slid further amongst the Muslims; after creating much noise over giving 15 per cent reservations to Muslims in jobs, the party had finally agreed to give a representation of 8.44 per cent to backward Muslims within the stipulated 27 per cent. But that order was subsequently reduced to a caricature: it transpired that what the BSP meant was not a special provision for backward Muslims but a mere issuance of certificates to backwards amongst the community. There was natural consternation over the whole issue and since then, the BSP has been hardpressed to make up to the Muslims. One of its methods was to extend, incredibly, the coveted Z security, which is provided to VVIPs and is currently enjoyed only by Kalyan Singh, Mulayam Singh and Mayavati, to a noted criminal of the Ghazipur district, Mukhtar Ansari. Its other move was to raise as far as possible, the temperature over VHP plans and appear as a saviour of the Muslims.

For both the BJP and BSP the occasional striking of pro-Hindu and pro-Muslim postures is taking on increasingly, the contours of a peculiar game of tacit understanding. This perception is strengthened further by the fact that even at the height of the controversy it was becoming apparent that a compromise formula would be worked out and the alliance partners would not go so far as to jeopardise their political agreement. The BJP's strategy was also presumably to effect a rift in the BSP, particularly between Kanshiram and Mayavati and explore possibilities for an alliance with the latter; especially in the light of Kanshiram's attempts to move closer to the prime minister Rao.

But immediately after the Mathura episode and the grant of security to Mukhtar, dissensions within the BJP have emerged openly on the question of support to the Mayavati government. Recently Kalyan Singh issued a couple of statements against the administrative failures of the Mayavati government and went so far as to issue threats of dislodging it. Mayavati replied by lashing out against the former chief minister and enlisting the support of Advani and Joshi. Soon after, however, the top leaders of the BJP themselves chided the chief minister for claiming in print their support against Kalyan Singh and since then the controversy has been going on. Speculations about the possible fall of the government have once again become rife and a Murli Manohar Joshi vs Kalyan Singh rift is also being predicted. Yet, the controversy might blow over for the BJP would like to retain Mayavati till at least the threat from Mulayam Singh is sufficiently contained. In fact, the BJP organisational meet at Bithur held in the first week of September has finally decided to continue support to the government.

The other interesting feature of the whole episode right from the Mathura controversy was the inability of Mulayam Singh to emerge significantly. His role during the mahayagna

was limited to issuing mild statements and his passivity came in for criticism from the Muslims. In rallies held before the event Mulayam was trying mostly to appeal to upper caste voters; the apparent calculation was to move a section of them closer to the Samajwadi Party in a period when the Congress is disintegrating. Mulayam, it seems, is still trying to work out the pre-breakup equation; the only problem is that a belief about Muslims and backwards voting for him again in the same manner is just too simplistic to sustain. In the absence of any other alternative, sections of the democratic intelligenstia are ardently wishing the renewed rise of Mulayam. But the latter is not complying with the same earnestness; his efforts proved to be a damp squib during Mathura and in general too, the former chief minister has yet to drum up a credible anti-BJP, anti-BSP plank based on issues rather than a mere rhetoric against his ouster from power.

This is so even when the much trumpeted entry of Sonia Gandhi into Amethi did not become much of a statewide issue. Amethi has been a traditional stronghold of the Gandhi family and the reception accorded to Sonia was quite generous. An open anti-Rao rhetoric also made big headlines, but the significance of the whole affair was limited to Amethi and the inner politics of the Congress. In other parts there was not much of a ripple and it remains to be seen how far Sonia Gandhi can play a role in the changed situation of UP. The same predicament is till stalking the Tiwari faction of the Congress, which despite the best efforts has yet to carve out a niche for itself.

These forces right from Mulayam to N D Tiwari are unable to take full advantage of maladministration and anarchy that has become the order of the day in the BSP regime. In near panic the Mayavati government has started a campaign of transferring and suspending officials the arbitrariness of which is creating further problems. The BSP government is also meeting the demands of the rural poor and the dalits for land reforms and minimum wages with repression. A movement along these lines has emerged in parts of east UP being led by the Poorvanchal Kisan Sabha, a front organisation of the CPI-ML. Probably after many decades, a land struggle of note has come up in UP: in areas of Benaras, Ghazipur and Ballia sharp struggles are being witnessed which in Benaras have acquired the dimensions of armed confrontations. Here struggle is centring around more than a thousand acres of land belonging to the Kashi Naresh in the Chakia block and land seizures are also taking place against a number of the neo-rich landlords. The CPI-ML is co-ordinating this struggle of the grass roots with the larger political one: it has announced a big peasant march in Benaras on October 14, on the question of communalism where the strugge of the peasantry for land will be combined with the struggle against the political forces of communalism. The social and political basis for the latter in an agrarian society like UP is actually provided by the landlords of the countryside who are the main props of the communal ideology. In the current atmosphere of the state, riddled with the prospect of the extension of Ayodhya to Varanasi and Mathura, a march like this in Varanasi might open a new chapter in the beleagured annals of UP politics. Elsewhere too, the actions of the BSP government are leading to the prospects of new unrests in the days to come. In an extraordinary move, the chief minister appointed Bua Singh, the prime accused in the Muzaffarnagar killings of Uttarakahand activists, in charge of the crime branch, thus treading, rather imprudently, over the feelings of the people of Uttarakhand. This has opened up possibilities of the revival of agitation in the hills with students once again gearing up for a fight.

NEW ZEALAND

LECTURER IN HISTORY
(SOUTH ASIAN HISTORY)

Applications are invited for the above position in the Department of History in the area of South Asian History. The minimum qualification on appointment is the Ph.D. degree or equivalent. Some teaching experience and a proven research record as shown by refereed publication will be advantages. Applicants should be specialists in the field of South Asian History; an ability to teach Southeast Asian History would also be an advantage. Initially, the primary teaching responsibilities will be: to contribute to the teaching and development of team-taught survey courses in Asian History and in Global History at the lower undergraduate levels; to design and teach some specialised courses in South Asian History at the upper undergraduate, Honours, and/or postgraduate levels; and to supervise postgraduate research. Staff members should actively engage in research in a special area of interest. Candidates are invited to submit a brief statement along with their curriculum vitae, indicating their experience of South Asia and what courses they could develop at the undergraduate and postgraduate levels; and to provide copies of recent publications.

Academic enquiries may be made to: Professor W D McIntyre: Telephone 64 3 364 2085, Fax 64 3 364 2003 or email <j.robertson@hist.canterbury.ac.nz>.

The salary for Lecturers is on a scale from NZ$42,000 to NZ$52,000 per annum.

Applications close on 30 November 1995.

Further particulars and Conditions of Appointment may be obtained from the undersigned. Applications, quoting Position No. HY64, must be addressed to: Mr A W Hayward, Registrar, University of Canterbury, Private Bag 4800, Christchurch, New Zealand.

The University has a policy of equality of opportunity in employment.

Strategy of Containment

Dangi Darbar Drama

Lancy Lobo

The annual ritual of honouring the ex-rulers of the Dangs camouflages the growing impoverishment and uprootment of the tribals of the region.

DANGI DARBAR is generally held just before Holi. This year it was held on March 13, 1995. Five Bhil (tribal) rajas (kings) of Dangs were given their 'political pension' by the Dangs district administration at a public function. This practice is 153-years old and was started by the British. The idea was to co-opt and appease the Rajas in exploiting Dang's resources. The logic for continuing this institution after independence remains the same. Following is a report of this year's Dangi Darbar followed by some comments on Dangs and on the nature of development in general.

Dangi Darbar

Ahwa is the district headquarters of the Dangs. It is situated on a small plateau on the hills. It mainly houses government offices, and residential quarters mostly for non-tribal officers. The largest fair of the year in the area is set up mostly by the non-tribals. The most prominent items of the fair are the giant wheel, grocery shops, cloth, electronic items and other household items. A few forest products were also seen. The area gets crowded at the bazzar and the fair site. On the periphery of the fair a large number of Dangis, mostly Bhils, camp with their bullock carts. With small fires lit women prepared 'rotli'. Others were eating, smoking and drinking. Just below the government circuit house a large 'shamiana' with a stage was set up for holding the darbar.

In the morning of April 13 the Dangi tribals began to come into the shamiana. There was a large contingent of forest guards and policemen monitoring the people's movement. The space inside the shamiana was divided into three parts – the stage and its frontal and the rear sections. On the stage there were a couple of rows of expensive chairs followed by some ordinary ones. Facing the stage were simple metallic chairs with the rear side having only space for sitting or standing. The chairs on the stage were meant for the officials, Rajas, Nayaks, 'Bahubands' (relatives) of Rajas, and the chairs below the stage were meant for non-tribal guests and the last section was meant for tribals.

Later, the official cars rolled in, according to their hierarchy and occupied seats on the front row on the stage. At the centre of the stage was the chief guest – the administrator of Dangs, R L Meena who is also the commissioner for the cottage and rural industries for the district. On his right was the chief conservator of forests, Balaguruswamy, with two DFOs. DSP and on the left of Meena were the collector, DDO, the newly elected MLA of Dangs and then rajas of Gadhvi, Linga, Daher, Vasurna and Pimpri.

This seating arrangement reflected the power structure in Dangs. The powerful bureaucracy on the right, the nominal rajas on the left and the politician (MLA) in between. He was the centre of attraction and attention, the centre of new power structure. The Ukai police band, especially invited for the occasion, played tunes to welcome the officials.

Among the rajas, the first one to arrive was that of Linga a middled aged person in dhoti, shirt, headgear and shoes. Second was the king of Daher, aged about 25, in white pant and shirt, with no headgear, but a pair of old *Hawai* slippers in his feet. The king of Pimpri an eldery person arrived third in dhoti, shirt and headgear. After much waiting the fourth Raja of Vasurna arrived. The fifth king, the raja of Gadhvi, was absent and the programme started without waiting for him as he had not been attending the darbar for a couple of years. It was reported that he was 'missing' for two years. Then came the newly elected MLA with elaborate 'Ram Ram' greetings to the police, and everyone.

The master of ceremonies called on all the nayaks as well as bahubands to come and occupy the seats on the stage irrespective of their age. Symbolic honour was to be given to the tribals irrespective of age. The seats on the stage fell short of requirements and a few bahubands were found sitting on the floor of the stage.

The rajas were brought in the government jeeps sent to their respective villages. It was reported by an official that without jeeps rajas would not come to the darbar. This is doubtful. Rajas were very ordinary persons. As the raja entered the shamiana with his bahubands it was difficult to make out as to who the raja was, until he occupied the appointed chair. There was no apparent difference between him and his relatives. Rajas were not greeted by the senior officials; nor did they stand up as the former walked up to the stage. Neither did the rajas greet the people or the officials. The police band too did not particularly greet the rajas as it did the officials. A petty official showed the rajas their seats.

This shows a duality on the part of bureaucracy. They continue to stagemanage an institution apparently to honour the rajas but their behaviour showed that they themselves are the real rajas. Rajas were pinned with a badge which was actually used by the election officials a few days ago. It had no meaning but was decorative.

The MLA was greeted by the officials and he in turn greeted them back. He was the new raja of Dangs. There were two pedestal fans on the side of the officials, but none for the rajas on the stage. A hoarding on the stage read, "Dang Darbar 1995, Vanvibhag, Dang, Ahwa. Aag Nivaran Inamo Vitaran Samarambh" suggesting that the occasion was also used for distributing awards for controlling forest fires. There was a Doordarshan team recording the proceedings with a few photographers and press persons.

Introductory remarks were made in the Dangi dialect by an official on behalf of the organisers of the function, viz, the forest department, the revenue department and the sarkar in general. He said that though the kings in the world are different, the Dangi kings fully trust the government, take what it gives, obey what it says and that is the reason for continuing the custom started by the British a century and a half ago. As we shall see later, the first part of the comment is totally false. The second part was an exercise in co-opting and appeasing the rajas. After these words a group of primary school girls, mostly from non-tribal families in the Taluka school, sang a prayer, "Hamara dharma hai seva, karma hai seva, vatan ke liye jeena aur marna" (Our holy duty is to serve and to live and die for the nation). One needs to ask if tribals were part of this nation and what benefits they got. Girls also sang a welcome song, "Nati heera ke moti, arpan shun kariye" (We do not have emeralds or diamonds and so what could we offer you?). The police band played the national anthem.

The garlanding ceremony began with the officials garlanding the rajas. The garlands were given in their hands. The nayaks were garlanded by another official. Later the chief guest garlanded the MLA. Other officials were also garlanded by each other.

The welcome speech was given by a who addressed the guests of honour by their names. He however did not name the rajas (probably he did not know or it was not significant in his scheme). He said that Dangs was paavan bhumi (holy earth) inhabited by the Lord Rama himself during his Vanvas and known as the Dadakaranya from where the name of the region was arrived at. The British began the Dangi Darbar and this good custom has been carried out because people like to honour their kings, he said. He pleaded that this enthusiasm of the people should not only remain limited for today but continue.

The function was inaugurated by the chief guest who was invited to light the lamp. He in turn invited the MLA, the collector, the chief conservator and the DDO but not the rajas, to light the lamp. Then the collector went to the rajas and gave political pension, comprising of a cheque, khes (clothes) and pagdi (turban) to the rajas of Vasurna, Pimpri, Linga and Daher in that order. This year for the first time the nayaks were also honoured. But unlike the rajas they came to the collector to receive the awards. The table shows the amounts distributed to the rajas, nayaks and bahubands. The forest department headed by the chief conservator also gifted clothes to the rajas.

A folk dance known as Pavari was enacted just below the stage on the open ground. The police band played some music. This was followed by a series of speeches by officials.

The DDO made the first speech. As he kept emphasising figures and statistics, the tribals began to move off from the shamiana to the fair. He said that the Dangis were poor and no development had taken place. While only a few works had been done for them a lot was still to be accomplished. He voiced his concern about the tribals by saying that they let their cattle loose instead of stall-feeding them. Hence they lose dung as well as milk. He urged them to stall-feed the cattle so that both can be saved, viz, dung for enriching cultivation and milk for consumption. Stall-feeding suggestion was very absurd in the Dangi context. It only exposed how alienated this official was from the tribals. The Dangis cannot but take their children when they migrate and cannot help but let their cattle loose for grazing. His second concern was with the children. Dangis migrate to the plains after Diwali for wage labour in the sugarcane fields and their children accompany them. Hence, their education gets hampered. He said that the ashram schools could be enforced to accommodate more than the stipulated number for the migrants' children. The DDO was a tribal from the Panchamahals but seemed to be totally alienated from the tribal reality of the Dangis. Migration was a structural feature. Little teaching is done in Dangi schools and ashram schools are jersey cows for the local politicians. It was reported that the DDO, instead of implementing poverty alleviation schemes in the district, distributes money which is used by the people for consumption of liquor and not in income generation activities.

The collector identified the major problems of the Dangis as related to land, water, education and migration. He pleaded that he had taken up this assignment only recently and would see to it that more land was made available to the people. He emphasised that for the development of Dang, the unity and co-operation between the Dangis, officials and rajas was a must.

The newly elected tribal MLA of the Congress Party, Madhobhai Bhage, stated that while Dang is rich Dangis are poor. Dang, though receiving 150 degrees of rain, is very thirsty. Dangi water is dammed and taken to the plains where Dangis go for wage labour. Dang needs check dams which the forest department does not allow. He advised people not to listen to the naxalites in Dangs who say, "Cut jungle and cultivate". He exhorted the people to take to ambar charka, handloom, furniture and carpet making, handicrafts and toys to generate more income. At one point of time an official requested him rather loudly on the microphone to switch over to Dangi dialect from Gujarati. He did it but then the electricity went off at this point and the public address system failed to carry his speech further. In the midst of his speech the youngest raja of Daher, with pant and shirt, jumped off the stage and went away never to return for the remaining function.

The chief conservator made his speech despite the failure of the public address system. He said that 35 check dams costing 56 lakh rupees had been built by the forest department and promised ownership rights of land to people and 'maafi' cards.

Later the award giving ceremony for putting off forest fire was held. Those awarded were the police patels and the karobaris of villages. The police patels were given blankets and the karobaris brass utensils. There were awards for children who took part in elocution competition on a topic related to environment.

Finally, the chief guest who is the administrator of Dangs and commissioner of cottage and rural industries recalled the open house discussion he organised to discuss Dang's problems last year and mentioned the 22 crore of rupees of development projects. The rajas were given shawls and a lunch, known as 'samooha bhojan', was served for officials, rajas, nayaks, bahubands, and people.

During al these activities and functions none of the rajas, nayaks or their bahubands spoke officially. Neither were they called up to speak.

As part of the Dangi Darbar celebrations for three nights entertainment was organised by the officials in the same shamiana where the darbar function was held. Most of the items were tribal songs and dances performed by well trained troupes. The Kahadiya dance performed by young girls and boys came in for much appreciation by the crowd. In another item two Bhuvas (oracles) came on to the stage with their torses, began howling, vibrating as if in a trance. They were handed with burning fire-wood sticks which they freely applied to their own chest, arms, legs, backs and also hit each other. They bit pieces of burning embers and spewed them out slowly, shrieking, yelling and vibrating all along. This religious ritual of the tribals amused the non-tribal crowd. It elicited from them some contemptuous comments regarding tribal religion.

TABLE: POLITICAL PENSION TO DANGI KINGS, NAYAKS AND RELATIVES

Name of the King	Kingdom	Monthly Political Pension (Rs)
Yashvantrav Umarsing Pawar	Gadhavi	3084
Shagatrav Anandrav Pawar	Daher	2099
Bhanvarsing Hasusing Suryavanshi	Linga	2328
Sahebrav Bhavaurav Pawar	Pimpri	2535
Chandsing Somansing Pawar	Vasurna	1889
		11935
Nayak		*Monthly*
Bhulsing Devsing Pawar	Kirli	435
Jivya Rangu Pawar	Shivvara	321
Bhavanrav Fatesing Pawar	Chinchali	421
Motiram Mahadu Pawar	Avsar	149
Umarsing Rahirav Pawar	Ranasvir	110
Lalsing Laxman	Vadiavan	105
Janerav Kanjurav Pawar	Piplaidevi	151
Avsu Ganpat	Gadkhadi	733
		(Yearly)
Mahadu Bhavja	Bilwadi	927
		(Yearly)
		3352
Bahubund of Kings (Relatives)		*Yearly*
146 persons	Gadhvi Raj	1,55,760
146 persons	Basurna Raj	1,53,314
101 persons	Linga Raj	1,46,600
65 persons	Daher Raj	74,457
76 persons	Pimpri Raj	87,22
		5,17,355

The Dangs District

The district of Dangs is at the southern end of the tribal belt in eastern Gujarat. Dangs has 31 villages and is forested with hills and valleys. The only three townships are Vaghai on the hills touching the plains, and Saputara and Ahwa on the crest of hills. Over 90 per cent of Dangi population is tribal. It consists of tribes such as Bhil, Kokana, Varli, Kotwalia and Gamit. Almost all land is under the forest department. Hence, the revenue department has little significance. People cultivate on slopes and grow only one crop mainly nagli (a coarse grain) They often come in conflict with the forest department for the use of land, water, fodder and fuel. After Diwali, the working population migrates to the plains for harvesting sugarcane to earn a livelihood. They also sell forest products and rear cattle.

Dangs was ruled by the Bhil kings. In the 18th century they raided the neighbouring territory controlled by the Peshwas of Pune and the Gaikwads of Baroda. The latter took a policy of appeasing the Bhil kings owing to their inability to subjugate them. The British conquered Dangs but did not make any effort to rule it directly. They ruled the region informally. But some local officials employed by the agent took advantage of the Bhils. In retaliation, the Bhil king of Gadhvi raided British villages. The agent realised that grievances of the Bhils were not redressed. Periodic meetings between the British and the Bhils were held from 1843. But from 1870 onwards these came to be known as annual Darbar during which the collector discussed with the chiefs and their followers their grievances, admonished those who created trouble and handed over their customary payments This became a tradition and came to be known as the 'annual darbar'. The chiefs were given turbans, clothes and payments. Payments in turn were divided between chiefs and their bahubands (relatives).

The British needed high quality teak for building warships and signed leases with the chiefs of Gadhvi, Vasurna and Pimpri in 1842 for a pittance. The lease agreement was one-sided and the Bhils were put on the defensive, allowing the British to do what they liked in Dangs. The chiefs could not operationalise their earlier arrangements with timber merchants and the adverse implications of the lease dawned upon the chiefs much later. The improved leases allowed more money to the chiefs, and wood for personal use. However, the chiefs began to articulate their protests against the forest officials. The forest officials began to take an authoritarian view to conserve forests as the demand for teak increased with the coming of the railways. Teak was preferred for railway sleepers. In 1850s the forest officials put a ban on lopping of branches for cultivation purposes in the Dangs. The forest officials also tried to arrest shifting cultivation in Dangs to conserve forests. In 1893, 34 per cent of Dangs was demarcated as reserved forest. Only the Dangis were allowed to cut bamboo in reserved forests free of charge and hunt, fish, and collect forest products but not touch the wood or cultivate. Though the lease payments to the chief were increased, the protests by the people as well as the chiefs also increased. Gradually, the population of Dangs increased. To add more confusion, the Parsis struck a deal with the chiefs to begin liquor manufacture and sale in Dangs and eventually set themselves as an alternative centre of power.

The British did not take the protest of the Bhil chiefs seriously. The chiefs encouraged the peasants to cultivate reserved rather than unreserved areas. In 1910 the British constructed their headquarters in Ahwa. Forest rest houses were constructed at strategic points. Forests were reclassified Award were announced to smaller chiefs and headmen of villages who managed to prevent and put out forest fires. Tension mounted between the British and the chiefs, and outbreaks were recorded between 1907-1914. The British put one tribe against the other, viz, the Kokanas versus the Bhils. The last years of the British rule were very oppressive for the Dangis The forest officials forced people to accept wage labour as well as unpaid labour for touring officials. They meted out harsh punishments to those who infringed rules [Hardiman 1994: 89-147].

Though the princely states, and later, privy purses were abolished, the Dangi chiefs continued to get their annual payments which in 1954, were rechristened as 'political pensions'. Gandhian workers settled in the Dangs and carried out Hinduistic reform and educational activities and succeeded more with the Kokana tribe rather than with the Bhils.

Currently the tribal population of the district is above 90 per cent. The total population has drastically increased over the decades. But the life supporting system of the tribals, i.e. land, fuel, fodder and water has been increasingly slipping off their hands on account of the implementation of government's forest policies. As 95 per cent of Dangs comes under the forest department the revenue as well as the police department have only a nominal role and more often than not inter-departmental conflicts arise with the forest department which asserts its supremacy. For instance, most of the function was organised by this department. It is reported that the revenue department has a number of income generating schemes such as wood workshop, ambar charka, etc. But some cash is distributed to the tribals instead of operationalising these schemes. The forest department also builds some check dams as part of its appeasement policy to contain tribal discontent. But there is trouble brewing in Dangs especially as the policies of the forest department have become harsher than those during the British times. The atrocities of forest personnel are fairly well listed by people and activists.

On account of forests being classified as reserved and protected, the cultivable space has reduced and in reserved forests no cultivation can be undertaken. Tribals who have been practising shifting cultivation and had no concept of private property, have increasingly been subjected to regulations which have alienated them in their own land. Because of their increasing unrest, the government appointed a committee in 1992 to study the response of the state to similar conditions in the neighbouring Maharashtra and submit a report with its recommendations. After six months, the same year, the committee submitted its report with the following guidelines:

(1) Regularise land cultivated before 1980 under the following conditions: (a) even if a person has cultivated only once before this date and forest department has registered an offence against him; (b) the person should be a local; (c) a maximum of eight acres can be regularised per person; (d) half of the regularised land need to be used for agro-forestry.

(2) The period under consideration for regularising is between 1960-1980. It is valid for institutions as well as individuals. Once the list of those whose land is to be regularised is ready it has to be read in the village square. Anyone, having been missed out should apply to the department within a month. The finalised list will be sent to government of India and on its approval the surveying and regularising work will be undertaken. If trees have been planted before 1980 they shall belong to the government and only those planted after that date shall belong to the people. No cultivation after 1980 can be regularised under any condition.

So far promises in this GR have remained on paper. People are getting restless with the delay and the inaction of the government. The forest department deals with them with a heavy hand. Any protest is dubbed as naxalism. The forest department has dug holes in the land cultivated by the people

to plant trees in villages such as Khatol, Khandolpada, Patari, Khosimpatar and Dhundumya. A visit to Khatol village about 35 kms from Ahwa revealed that on February 25 the department came with labourers to dig holes in the land cultivated by people. It is reported that the department has gone ahead despite the stay order brought by the people. Earlier during the month the department had gone to Khosimpatar for the same purpose but had met with strong resistance put up especially by women. The women had thrown itching powder on the officials who then had no choice but to return. It is reported that action such as inflicting National Security Act, Chapter cases, etc, against the protesting people is contemplated by the officials.

Conclusion

The infrastructure set up by the colonial government with the aim of exploiting Dangs has got reinforced in independent India. Harshness in implementing forest policies has increased, and so have atrocities against the Dangi tribals. With increasing population the region has witnessed problems related to land, fodder and water. The institution of Dangi Darbar begun by the British continues today and has a definite purpose. The Bhils and their ex-rulers are symbolically honoured once a year with turban, cash, shawls, clothes, lunch, jeep ride and verbal flattery. This is to serve the purpose of appeasing, co-opting and containing the Bhil chiefs as well as the people. There appears to be two objectives for holding Dangi Darbar. The manifest function is to make a bravado of honouring the Bhil kings. But the ceremony is carried out in such a manner that kings are made to appear almost clown-like. The officials show little deference to the kings. The latent function of Darbar is to contain the assertion and protest of the tribals. The incident of the youngest king wearing pant and shirt jumping off the stage and walking away never to return points to the fact that the tribals have seen through the official game.

The speeches of officials shedding crocodile tears for land, water, fuel, fodder and illiteracy are not taken seriously by the people. Many tribals moved off to the fair and some remained there to have a free meal at the end. "The forests are yours and we are here to administer them on your behalf", sounded hollow.

The Bhils confronted the British with bows and arrows and lost. They were totally subjugated and hoodwinked into signing a lease. The rulers in the post-colonial era have continued the trend but with more vigour. Symbolic meals, cash gifts, darbars, and other gifts may not be enough in the coming years. The Dangis are gradually getting literate. The tribal elite is inhibiting this process so that they can continue to cash on the ignorance of ordinary tribals and corner the benefits of development such as income generating programmes, ashram schools, and poverty alleviation schemes. How long the itching powder can repel the forest department is anyone's guess. Because Dangs supplies not only a large part of the state's demand for timber, firewood and bamboos, but also crores of rupees of revenue.

Dangs illustrates the kind of development that has taken place in rural India especially pertaining to the tribals. Pockets of natural and forest resources are enclosed into reserved and protected plots in the guise of national interest. People who have lived for centuries in these habitats are made to feel alien in their own environs by state policies which impoverish and oppress them. Dangs has become a labour colony for the adjoining districts during the harvesting of sugarcane. The uneven development at regional and sub-regional levels, and keeping the weaker sections weak and further marginalised has become the hallmark of the current developmental model. Having deprived the locals of their own resources, some developmental crumbs are extended to them in a very paternalistic manner. The state-sponsored development schemes are not methodically implemented and most of these schemes generate only little or no income. Doling out cash to people further degrades the self-image of an already degraded people.

UNITED STATES

Labour Day Blues

In the US the first Monday of September is Labour Day. While it is a national holiday, this year far from there being any celebration, there has been grave concern all round about organised labour facing a crisis of survival across the country.

THE first Monday of September every year is Labour Day in the US. This year was the 101st anniversary of the celebrations which began as an official national holiday in 1894. Peter J McGuire, a socialist who helped found the carpenters' union, had in 1882 proposed the idea of a labour day to honour working men and women in the US.

What must have struck any visitor this year is that, far from there being any celebration, there is grave concern all round about organised labour facing a crisis of survival across the country. On the eve of the Labour Day one of the regional newspapers, not known for radical views, gave front-page accounts of the helplessness of the working class – a lady praying and fasting as the day approached because now for more than two years she, her husband and 700 others had been out of work because of a labour dispute in a corn sweetener producing company; more than 2,400 workers who had struck work in a caterpillar plant in June 1994 are still idle; 1,200 workers who had walked out of a tyre plant in July 1994 called off their strike on May 21 this year, but only a few hundred have been taken back to work, and so on.

It has been repeatedly highlighted how the typical American family has been working more and earning less. Even as growing company profits have fuelled a stock market boom, corporations have destroyed jobs, slashed employee benefits and reduced real earnings. Estimates suggest that inflation-adjusted wages fell by 10.5 per cent between 1983 and 1993. Hourly earnings of temporary workers have been eroded in real terms by about one-fifth. Even women taking up jobs in increasing numbers and men picking up second jobs have not fully compensated for the general loss of earnings. Median family income sank by $ 1,300 between 1989 and 1993. But as middle-income wage earners took a beating, the average income of the richest 1 per cent of American families rose by a whopping 63 per cent in the 1980s. While corporate chiefs have slashed jobs and wages, their own average salary went through the roof from $ 1,54,000 a year in 1979 to $ 4,29,000 in 1989.

Trade unionists and neutral commentators point out that the radical redistribution of incomes and wealth began under president Ronald Reagan, who claimed that large tax breaks for the rich would eventually 'trickle down' to the rest. The Republican-controlled Congress now plans to continue with the biggest tax-breaks, an average of $ 20,000 a year, to the most well-off Americans. It has been recalled how corporations and the Republican party had teamed up in the 1920s to drive down wages, crushing a weak trade union movement. The result was the crash of 1929 and the great depression. Many see a parallel in the current situation.

Experts from the Rutgers University in New Jersey suggest that trade unions could become irrelevant in a few years. In the late 1800s, the condition of the American workplace was appalling: poor wages, long hours, hazardous work and poor benefits. Relentless struggle by the working class helped raise workers' standards of living and conditions of work – 8-hour day/40-hour week, pension and health facilities, unemployment insurance, promotion of technology by the public education system were all a direct result of the labour movement. The eventual merger of different unions into the American Federation of Labour and the Congress of Industrial Organisations (AFL-CIO) some four decades ago marked the height of working class power.

The glory has waned. The big corporations have acquired powerful socio-political clout and succeeded in dismantling many a state regulation favouring the labouring classes. The trade union leadership grew complacent after the heady days of the 1960s and 1970s, when the capitalist world experienced a long period of buoyancy. Membership of trade unions has declined rapidly. A new generation of corporate managers have been emboldened to intimidate workers, threaten closing of plants and send jobs out of the particular areas and states and even the country. The new generation of workers look upon the promises of union organisers sceptically and question the relevance of union bureaucracies "whose aging leaders sometimes seem as removed from their lives and concerns as corporate managers".

A research study under preparation on 'The Twilight of Unionism' at Rutgers University has apparently predicted that union membership in the private sector will dip to 7 per cent by the end of the century, the same as it was at the beginning of the century; it has already touched 10.8 per cent. Labour's clout is stronger in the public sector, where 38.7 per cent of the workforce belongs to unions representing teachers, postal workers and other government employees. But with federal and state governments facing budgetary cuts, members of public unions also face significant threats.

The new growth industries of communications and information technology firmly discourage trade unionism. In parts of southern and western America, where economic growth is the fastest, union members are hard to find. A study at the Florida State University has shown that in the ten states with the most employment growth, while nearly 11 million new jobs were created between 1983 and 1994, union membership actually declined by 1,66,000. Just 8.8 per cent of workers belong to unions in Texas. South Carolina has the lowest proportion of the workforce in unions, at 3.8 per cent. Even in the north-east and mid-west, centres of the country's older manufacturing industries, union membership has been receding. In Michigan, birthplace of the heavily unionised automobile industry with the United Auto Workers headquartered there, union membership dropped from 32.8 per cent in 1983 to 23.8 per cent in 1994. New York which continues to have the highest proportion of union membership, because of state, municipal and other public sector workers, nevertheless saw union membership fall from 32.5 per cent in 1983 to 28.9 per cent in 1993.

The changes in the political climate with 12 years of Republican presidents and a year of the Republican Congress have contributed a great deal to the decimation of the trade union movement. The once-powerful trade union spokespersons in the Congress have been all but rendered powerless. In the previous Democrat-led Congress, a Michigan representative, William Ford, was the chairman of what was then called the House Education and Labour Committee. In the new Republican Congress the word 'Labour' has been dropped and the committee is now called Economic and Educational Opportunities Committee and its chairman, William Goodling, is a pro-business Republican from Pennsylvania. The Michigan representative on the committee is a former furniture company executive from the state's conservative west-side – a sore point with trade unionists, but they have not been able to do anything about it. A Republican representative, who has been chairing this panel's subcommittee on oversight and investigations, has gone to court against president Clinton's order banning business with companies that replace striking workers. He has sponsored a bill to let non-unionised companies establish workplace teams without collective bargaining. More disturbing for union leaders has been his attempt to repeal the 64-year old law guaranteeing top wages to employees on federal contracts. He has even gone to the extent of suggesting that the

Occupational Safety and Health Administration, the federal agency that enforces workplace safety standards, be disbanded.

Apart from the political climate, disenchantment with the trade union movement amongst workers has come about because of the apathy of the leaders of the movement. The current debate about the presidentship of the AFL-CIO is significant. In August this year Lane Kirkland, 73, completing his 16th year as president of the AFL-CIO, the federation of 80 unions with over 13.3 million members, had to resign after 11 top trade union leaders charged him with failure to strengthen the movement. A serious leadership tussle has now begun for the October elections for presidentship of the federation, the two contestants being Thomas R Donahue, 67, who had been secretary-treasurer during Kirkland's presidency and John J Sweeny, 61, who has been the chief of the Service Employees International Union and an architect of doubling the membership of service employees when all other trade unions suffered an erosion in membership. Some younger activists crave for a new generation of leaders who may galvanise the movement. Many of them are attempting to regroup by merging. In July, the United Rubber Workers decided to merge with the Steelworkers. More significantly, the leaders of three large industrial unions – the United Auto Workers, the United Steelworkers and the International Association of Machinists – signed a unity agreement pledging to create a single two million strong union by the year 2000 AD.

UNITED KINGDOM

Destruction of Mining and Miners

Mukul

The destruction of mining in Britain has left a legacy of unemployment, depression and decline, with poverty, social deprivation and decay in housing and infrastructure being commonplace.

STEVEN HARTLEY and Neil Wordsworth were working in Thurcroft coal mine at Rotherham for more than 20 years, when it was finally closed in March 1992. There were around 700 miners at the time of closure who got a maximum of 4,000 pounds redundancy money per worker. Steven and Neil were also among the hundreds of redundant workers and they decided to attempt to reopen the mine as a mine workers' co-operative by keeping their money in a trust fund as a part of the cost. But when British Coal asked the miners to pay 20,000 pounds, a week for pumping the mine and keeping it safe during the long negotiation period, they had to withdraw from the buy-out.

Disillusioned and disheartened, both were wandering from one place to another to find a job until December 1993, when altogether five redundant workers got into a training scheme of British Coal Enterprises. Now in a month's time, they are about to complete their training. But they do not know when and where will they get employment afterwards. Steven who is 43 years old says, "I don't want to think about my past, the British Coal or the NUM, but I also have nothing to think about my future. No way to make a living. Most of my fellow redundant workers are also unemployed like me, but I cannot say anything about them. I don't meet them."

In Wakefield, Armthorpe, Sheffield, Barnsley, Doncaster and Rotherham where the British government and British Coal have closed pits in the recent past, the redundant miners and the previous mining areas present a curious mix of contradictions: the redundant miners are there in all these places in large numbers since several years, but their present position, level of unemployment, socio-economic conditions, etc, are not well known even today, concealed to a large extent in government or semi-government circles. The government, both central and local, and various establishments related to governmental programmes among redundant miners proudly proclaim that the economic regeneration and employ-ment programmes have proved successful. However, the ex-miners, organisations like Coalfield Community Campaign and activists counter their claims as 'false', 'partial' and 'pretentious'.

Of course, there is booming business and various economic activities in the ex-mining areas, where new investments are coming, specially in the service sector and land, labour, landscape, infrastructure, everything is on sale. But all these are surrounded by the overall dominating background of a disheartened, disturbed and depleting human resource. A supply side economy has arrived, flowing from top to bottom, and the redundant miners, workers and trade unions have very little say in deciding their future lives and livelihood. Society and polity desire to get rid of their mining image and their doings and undoings in the recent past; but the past still dominates the present and haunts the entire life. Governments want to build a new economic community, but only after destroying the community spirit of society.

"Everybody is stabbed in the back, and left to fend for themselves", says an ex-Frickley miner in Wakefield district. The colliery was closed in 1993 and altogether 722 miners were made redundant. Frickley is not the only one, and many other collieries like Sharlston, Royston Drift, South Kirkby, Ferrymoor Riddings, Woolley, Kinsley Drift, etc, were closed and more than 10,000 miners unemployed. The closure has also taken place in areas adjacent to Wakefield district. In the Denby Dale ward, the last two collieries at Kirklees, Emley Moor and Park Mill closed, with a loss of hundreds of jobs. Savile, Ledston Luck and Allerton Bywater collieries in the Leeds district were also closed with a loss of almost 3,000 jobs. With Kellingley workforce being reduced from around 2,500 in 1984 to 500 in 1994, there has been a total loss of more than 6,000 mining jobs in the immediate vicinity of Wakefield district.

The Economic Development Department Fact Sheet of City of Wakefield Metropolitan District Council admits that, "other industries, particularly engineering, power generation, construction, and road and rail transport have also been affected. The negative multiplier effect of colliery closures means that at least two jobs are lost for every one in mining. In the mining engineering industry alone at least 2,000 jobs have been lost since 1984 in the Wakefield district and one of the last remaining major companies estimates that for each employee they have lost, five jobs have gone from their suppliers.... These related effects have meant that new job opportunities for redundant miners in adjacent areas or in other sectors of the local economy are severely curtailed."

The Wakefield and Dewsbury travel-to-work area is located within the boundaries of both Wakefield and Kirklees Metropolitan districts, within both the Coalfield and Heavy Woolen areas of West Yorkshire. The economy of this area is also experiencing a sudden and significant break from its traditional coal, textile and engineering base towards service, distribution and construction industries. However, this break has been at the cost of creation of a substantial number of redundant, unemployed and an under-utilised workforce – skilled in previous works, but unable to secure alternative employment; retrained in new works, but finding it difficult to be absorbed in new industries.

And the 'real' rate of unemployment in Yorkshire's coal fields is almost double the officially recorded figure. According to S Fothergill and Christine Beatty of Sheffield Hallam University, the real rate of male unemployment is at 22.8 per cent in the Yorkshire region, which is almost 10 per

cent higher than the official figure of 12.9 per cent. The spokesperson of Wakefield District Council concedes that the unemployment figures for the two travel-to-work areas, i e Wakefield and Dewsbury and Castleford and Pontefract, actually mask concentrations of much higher levels of unemployment.

The fall in employment can be largely attributed to the coal and water supply. Over 50 per cent of the unemployed miners have been unemployed for more than one year in the Wakefield and Dewsbury TTWA – a massive increase over the previous years. Face or other underground workers have virtually no job. Research by the Yorkshire and Humberside Low Pay Unit shows that 95 per cent of workers from the Wakefield area and 77 per cent from Kirklees are earning below 3 pounds per hour. "Not only is the pay low, but the workers have to travel greater distances for work, between 20 to 50 miles", says Roger Cojan of Coal Task Force in Wakefield.

Grimethorpe is few miles south of Wakefield district boundary, in the Barnsley district, where five pits have been closed since October 1992. Peter, an ex-Grimthorpe miner, comments, "The training and employment schemes are well intentioned, but the fact is that there are hundreds chasing one job, and companies do not bother unless you are experienced." "Jobs – what jobs?", angrily asks another ex-miner. A survey of redundant miners from Grimethorpe by Coalfield Communities Campaign in 1994 paints a gloomy picture picture of their situation. According to this survey, more than a year after coaling ceased at the pit, almost half of them remain unemployed. The majority of those who are now working have experienced a drop in their earnings, often a very substantial one. A massive 85 per cent of the former miners are worse off, even when they are looking for a wide variety of employment – factory jobs as well as driving work, service sector employment as well as in the building trade.

In the face of this massive destruction of industry, employment and community, governments are taking a number of policy and developmental issues to denote something closer to the 'regeneration of the borough'. Re-industrialisation is one of their grand objective: A balanced, adaptable economy, stable, well paid jobs; environmentally friendly industries; training and education, etc. But the policies allow industry and jobs at any price. Thus Peter Moore, head of the department of economic development, Barnsley Metropolitan Borough Council, sounds like this, "We are going for re-industrialisation and a strong manufacturing base is a pre-requisite for this. In the past six years, 80 new companies invested in the area and their fixed asset investment is around 500 million dollar. They are from the US, France, Italy, Japan, Turkey, Scandinavia, etc... We are a cheap place to manufacture. In terms of being attractive investment, a German labourer rates $ 25 an hour. We are half of that. As long as we are cheap and competitive, we can go ahead... Now many companies here don't have unions. They do not need the unions. It's a dramatic change. Though overseas investment has long memories that the UK is a trade union, labour oriented country. Particularly Americans have this opinion that UK has a bad track in unions. But now we have the best industrial relations in western Europe and sometimes it is better than the US as well."

Rotherham has the highest unemployed in the Yorkshire region. There were 11 mining villages and more than 15,000 miners. The destruction of mining has left a legacy of unemployment, depression and decline, where poverty, social deprivation, substantial decay in housing and infrastructure are common-place. Dinnington village, in common with other coal mining villages, had developed strong, supportive, close knit communities. However, with the loss of the common bond of the pit and its supporting welfare structure, the village and the community are breaking down dangerously. And the process of development of new community and voluntary organisations, or the strengthening of existing groups, is really slow. Michel, an ex-miner in this village explains, "First the colliery was closed. Then the shops, services, etc, also started to down their shutters. There were auctions of large number of properties. Even our houses were auctioned. We campaigned and stopped that. I, as a younger miner, got retrenched, hoping that I would find alternative employment. But that has not materialised. Some time after the closure, the redundancy problem actually came out, when the redundancy money went out... There has been a gradual deterioration of the vitality of our villages. The problem is not just here and there, it is a problem of future generations."

Chris Mallander, regional secretary, Coalfield Communities Campaign, and a representative of Rotherham Training and Enterprise Council worries, "It is now very difficult to create new jobs. In spite of new enterprises and training, it is a difficult process, because we have no direct control on the recruitment part. At last, Symphony Furniture is coming here and they would employ 1,200 people in Rotherham. They have agreed that they would try to employ the unemployed ex-miners of Rotherham. The incentives are right, framework is right. We have to see how it works."

But the coal business in private sector is once again booming, at the cost of workers and their rights. RJB Mining, which bought British Coal's English deep mines and open cast sites, is now finding its way to earn record profits. RJB now employs 9,165 including 7,300 miners in its 22 deep mines and 18 open cast mines. Output is running at 36 million tonnes a year. In figures for the year 1994, released on March 30, 1995, RJB lifted pre-tax profits by 32 per cent, to 16.1 million pounds, beating its forecast.

Markham Main Colliery is also back in operation, now in the ownership of Coal Investments plc. For long, the mainstay of employment in the mining village of Armthorpe between Doncaster and the M 18, the mine employed 2,500 men at its peak, but when British Coal decided to put into 'care and maintenance' in April 1992, 700 men lost their jobs. Clive Belfield, underground manager, Coal Investments plc, Markham Main Colliery, says in an exclusive interview, "In April 1994 negotiations were finally concluded. Now there are a total of 152 employees who produce 9,000 tonnes of coal per month." He clearly maintains, "We are quite selective in terms of recruitment. There were thousands of applications for jobs, so we could afford it. We don't have any one man-one job thing. We don't accept union. You can be a member of a trade union, but we will not collectively negotiate with the trade union. We will only negotiate with our workforce."

This is a common trend in Yorkshire and Humberside, where all the six privatised large pits are not recognising union at all to negotiate pay, working conditions, collective rights. As Paul Jagger, TUC regional secretary, suggests in Leeds, "They impose themselves on workers. The workers are really frighthened. The union strongly fears that the employers will further curtail the wage level and workers' rights, and also compromise with safety rules."

INDIA AND THE RAJ 1919-1947

Glory, Shame and Bondage

Vol. II

by

Suniti Kumar Ghosh

This book offers an interpretation of pre-1947 India that stands in dramatic opposition to the overwhelming weight of Establishment history.

Sustainability of Big Dams in Himalayas

Jayanta Bandyopadhyay

The debate on Tehri has highlighted the issues of displacement, sedimentation and seismic safety. It has also brought to the fore the possibility of an upstream-downstream conflict of international dimension near the borders of India, Nepal and Bhutan.

THE monsoon climate in south Asia has always encouraged ideas of storage of the abundant monsoon run off in the Himalayan rivers. From a purely hydrological point of view, storage and wider distribution of the great amount of water that flows in the Himalayan rivers during the monsoon provide an excellent solution to the ever increasing water demands from the drier plains of the Ganges-Brahmaputra basin. In the case of Asia, the projections indicate that in the year 2000, the amount of water demand will touch 22 per cent of the available water resources. This is the highest among all the continents [Biswas 1995]. The situation in the GBB is surely one of the most acute within Asia. Large parts of the GBB, specially in India, are the location of highly productive irrigated agriculture and fast growing industrial economies. They have generated large demand for water and hydro-power. The Irrigation Commission (1972) of India has estimated that by the year 2000, the requirement of irrigation water in the Ganges basin would be about 200 BCM. The hydro-potential in the Indian parts of the Ganges and Brahmaputra basins is estimated at 45,635 MW at 60 per cent load factor [Narasimhan and Singh 1994]. In the case of Nepal, the economically exploitable potential at 50 per cent load factor has been estimated at 45,824 MW [WECS 1992]. The domestic supplies in the number of urban areas scattered throughout the Ganges basin is fast proving difficult to maintain. For downstream country Bangladesh, the construction of storage dams in the Himalayan catchments of the Ganges basin is recommended as an ideal mechanism for the storage of monsoon flows that can augment dry season flow at Farakka [Choudhury and Khan 1983].

These various diverse interests have generated a view of inevitability of big dams on the Himalayan rivers. A few smaller projects have been already completed and several larger ones planned in the Himalayan catchments of the northern tributaries to Ganges and Brahmaputra. These include rivers all along the southern slope of the Himalaya, like Subansiri, Teesta, Saptakosi, Saptagandaki, Karnali, Mahakali, Alaknanda, Bhagirathi, etc [CWC 1992; Joshi 1994]. There is no doubt that from a purely hypothetical and hydrological perspective, storage of even a fraction of the huge flow and generation of hydro-electricity at the scale mentioned earlier, would go a long way in advancing economic transformation and development within the GBB in the next century. In short, these dams have been described as panacea for the poverty in the Himalayan region. However, decisions for the construction cannot be guided by hydrology alone and other factors have started getting their overdue attention. According to Beard (1995), "earlier, building large dams and diversions was an acceptable approach [in the US] as long as there were ample water supplies, plentiful government funds and as long as environmentalists and indigenous peoples had limited influence... All of that have now changed."

This change in thinking in the US is important as a background information due to the liberal use by the engineers of the achievements of the Tennesey Valley Authority in mechanically steam-rolling decisions on the building of dams in general, without much concern about the local specifics. In order that water development projects in predominantly poor areas of the Himalaya can be ecologically and economically sustainable and socially equitable, several other important policy dimensions related to the construction of big dams need to be looked into. In the absence of due attention being given to these important non-hydrological issues, the pure hydrological exercises on planning of large dams may soon turn out to be only an unrealistic dream. Over the past few years, public debate over the desirability or otherwise of the proposed big dam at Tehri in the Indian Himalaya and the relatively smaller proposed Arun III project in eastern Nepal has generated a wealth of literature. In this context of sustainability of big dams in the Himalaya, the debate over the proposed Tehri dam on the river Bhagirathi presents an excellent case for study. Due to the tenacity of the activists of the Anti-Tehri Dam Committee, the debate on the Tehri dam, which started naturally on the question of displacement of and compensation for the local people, has grown beyond the narrow hydrological focus and attained an unusual level of sophistication in ecological and economic terms. The wide range of literature on the broad policy issues that the Tehri dam debate has generated [Anon 1990; Bandyopadhyay 1990; Valdiya 1992] provides a rich information base. In this way, it can serve as a vital information base and important background for the evolution of overall policy guidelines for decision-making on other big dams proposed in the Himalaya. From this viewpoint the questions that have been raised in the Tehri dam debate are of vital significance in finding right solutions to the question of optimal utilisation of the Himalayan water resources on a sustainable basis.

Debate over Tehri Dam

Tehri is a small town in the Himalayan district of Tehri Garhwal of the Indian state of Uttar Pradesh. During India's post-independence push towards rapid industrialisation, a point downstream of Tehri was identified as a promising site for a big dam for hydro-power generation and irrigation. Official approval to the proposal for a 260.5 m rock filled dam was given in 1972 and administrative clearence at the state level was given in 1976. The Anti-Tehri Dam Committee was formed by local opponents in 1976 mainly on the question of displacement, compensation and rehabilitation. The opposition turned to environmental factors in the monsoon period of 1978 when a massive landslide dam-burst occurred in the upper catchment of the river producing devastating floods up to quite a distance downstream of the dam site. This provided the push for the establishment of a governmental working group for the assessment of the environment impact of the proposed dam. It should go to the credit of the Anti-Tehri Dam Committee and the Gandhian social activist Sunderlal Bahuguna (1995), that the environmental impact assessment of the proposed dam was started in 1980, and subsequently improved over years. In contrast, the scientific community of India, except a few exceptions, had hardly shown any early or independent professional interest in the issue so significant for the growth of science and the society in India. It goes to the credit of many environmentalists of India that this debate has now reached most interesting and challenging professional heights.

The report of the governmental working group further stressed on the issue of seismicity in the Himalayan region as a major limiting factor to be considered for

dam safety. In 1990 a more detailed investigation was undertaken by the Environmental Appraisal Committee (EAC) of the ministry of environment of the federal government. From the report of the EAC [Anon 1990] three important environmental and socio-economic factors, among others, have emerged. On the basis of these, the EAC recommended against the environmental approval of the dam project as designed. The parameters on which this decision was based include, the question of adequate compensation and resettlement for the involuntarily displaced population, on the question of higher rates of siltation and lower economic life of the dam and on the seismic risk associated with large dams in the tectonically active Himalaya. These factors are not specific to Tehri dam alone and will equally apply in the case of any other big dam in the Himalaya. As will be seen later, the construction of large dams for water storage to augment lean-period flow is seen as a solution to water conflicts in the lower parts of the GBB. This is why the debate on Tehri can be considered as a forerunner to the general policy and decisions on the selection of dam sites and structural design of the dams all along the Himalayan foothills, including, Nepal and Bhutan. This makes the Tehri debate an issue of basinwide significance.

There is another dimension to such debates on the large dams in the Himalaya. That is the possible extension of it to the status of an upstream-downstream conflict of international dimension. In the case of the Tehri dam, what is a national debate between the upstream and downstream interest groups within India, in the case of other proposed big dams near the political borders of India and Nepal or India and Bhutan, may surely become more complex in nature with the risk of the conflict becoming international in nature. If the questions which have cropped up in the case of Tehri are ignored for the present, they are bound to emerge again and again at different locations. It will, thus, be very important to address the specific issues of Tehri dam as representative of the general question of big dams in the Himalaya.

Displacement and Rehabilitation

In the densely populated foothill areas of the Himalaya, any construction of big dams is sure to inundate human settlements and the most fertile agricultural land. In the case of the proposed Tehri dam, direct involuntary displacement will occur for about 80,000 people. Indirectly, another large number of villages would lose parts of land or access road to the nearest towns in the plains. The national policy in India stipulates that the "living standards of those displaced should be maintained at least at the same level, if not improved, to what they were prior to their involuntary displacement". The richer and more influential residents of the town of Tehri as well as the government offices have been rehabilitated in the newly constructed New Tehri township. There are many problems, however with the displaced people of rural origin. Satisfactory rehabilitation is a term which is difficult to evaluate, specially when it is enforced through laws of imperial origin, like the Land Acquisition Act introduced by the British rulers of India. In the case of another big dam, the Three Gorges Dam in China, with a much larger degree of human displacement, Heggelund (1994) has described in detail this complexity and problems associated with rehabilitation. With the present level of marginalisation of the upland people, whose habitat are threatened by submersion, adequate and satisfactory compensation and rehabilitation may remain difficult for some more time to come. There is a need to redefine the ethical and procedural dimensions of the process on the basis of which a new legislation could be built for the purpose. There is no doubt that in an era characterised by growth of free market and privatisation, compensation and rehabilitation, official policy for land aquisition should not be driven by colonial instrument like the Land Acquisition Act. Instead market value and individual agreements should be the basis of such processes. Such a step, however, is sure to push up the cost part of the projects and reduce the authority of the various lobbies that operate through the functioning of the state apparatus. Its acceptance would also provide the upstream people in the hills and mountains with a good bargaining power for agreeing to allow water projects for the benefit of downstream economies. The disregard for ensuring proper rehabilitation and lack of human concern towards displacement, as was found in the case of the Tehri dam, and as noted by the EAC, may not be possible under that changed situation. The EAC observed:

> initially the project authorities had proposed to acquire forest land for rehabilitation purposes. However, with the promulgation of the Forest (Conservation) Act, 1980, forest land earmarked for the project are no longer available. The oustees therefore, logically ask, 'Where is the land?'

Such situations indicate the continued marginalisation of the upstream people in the question of decision-making on the upstream waters. This sort of uncertainty in the process of rehabilitation is bound to generate serious opposition from upland communities to the construction of big dams in their own habitat. In view of the density of the present population in the lower parts of the Ganges basin and the scarcity of forest land that could be used for rehabilitation, this basin presents a specially difficult situation in terms of compensation to the involuntarily displaced people. This is going to be increasingly important with growing awareness of the upland people of their continued marginalisation. However, after a long period of advocacy on behalf of the upland communities, recognition of these problems in the global platforms and the hope of protecting the financial interests of the upstream people is slowly emerging. In the third session of the UN Commission for Sustainable Development, it was stressed that 'there is a need to take a new look at the overall flow and full-cost pricing of resources and services to and from mountain area, including water,...' [UNCSD 1995]. The spirit of this stand taken at a global platform will soon have to be internalised and operationalised in decision-making. The issue of displacement and compensation should be sorted out through satisfactory and negotiated agreements. If the Himalayan waters are economically essential for the plains, it should be adequately paid for by the consumers. Any effort at making the upstream people sacrifice their economic interests will only enhance the delay in sorting out the displacement question and lead to far more economic losses. The delay in the case of the Tehri dam has already shown how costly it can be. All this makes it clear that if the hydrological advantages of the Himalayan rivers have to be economically utilised, development of effective economic instruments to compensate and rehabilitate the displaced people satisfactorily should be the starting point.

Sedimentation and Economic Life of Reservoir

A major factor in the assessment of the economic performance and efficiency of dams is the rate of sedimentation, both suspended material and bedload. Due to the geological and climatic peculiarities, the Himalayan rivers carry some of the highest sediment loads in the world [Bandyopadhyay and Gyawali 1994]. Hence, special attention needs to be given to this factor in the design and estimation of the economic performance of the dams. Neither the processes of sediment generation, nor the nature of its transportation in the Himalayan context have been studied and understood systematically. In the case of the Jamrani dam in the adjoining district of Nainital, the observations of Chandra et al (1981) is contradicted by Anbalagan (1990) and Anbalagan et al (1993). This divergence in the calculation of the sediment load and the lack of the knowledge of a convincing mechanism for calculating the impact of single large flood events on the nature of sediment transportation, makes the estimation of the life of dams in the Himalaya little different from an informed guess.

As a result, total chaos has reigned over sediment load calculation for the Tehri dam site. Long-term observations are missing

Whatever data has been gathered, the concerned process has not been sensitive to the basic dynamics and processes of sediment generation and deposition in the upper catchment areas of the river Bhagirathi. Singh and Raj (1992), on behalf of the Tehri dam project, has tried to relate the life of the reservoir with catchment area treatment alone, ignoring the fact that in the conditions of Himalayan watersheds, natural geological processes contribute overwhelmingly to the generation of the sediment load. This cannot be reduced by any kind of catchment area treatment. The EAC pointed out that 'the project authorities have taken the stand that the 1978 (the year of the major landslide dam burst in the upper catchment) siltation was unusual'. This was the basis for this high sediment load data to be excluded from the calculations of average rate of siltation. This runs contrary to the fact that in the Himalayan context, sediment generation is much more dependent on large events like the landslides than uniform soil erosion related processes. The sudden and uneven nature of sediment generation, as was observed in 1978, is the usual process and in no way it can be ignored. Exclusion of large events like the 1978 landslide undermines the very scientific basis of sediment load calculations. Such practices will invariably lead to an equally incorrect and high economic life of the reservoir. It is not an unexpected result that major Himalayan dams like the Pong in Himachal Pradesh or Ramganga in Uttar Pradesh have been silted up at rates four or five times higher than the assumed ones. The specific ecological conditions prevailing in the Himalaya demands a more complete information base on the totality of the sediment movement in the rivers to assist correct economic investment decisions being taken. This issue is equally applicable in all the dams proposed in the southern aspect of the Himalaya. Since a high sediment load will mean a lower economic life, this factor has a strong influence in altering the economics of the dam. When designed on the basis of more dependable and complete sediment data, the economic life of dams may turn out lower, as a result of which the price of the product, either water or power, would have to be much higher. Accordingly, the construction of dams may not be profitable without enhanced price of water or power – a situation under which the demand of these products may shrink substantially. If proper market survey is undertaken for the products of the proposed Tehri dam at free market prices, the economics of the dam may become very different.

Seismicity and Dam Safety as Limiting Factors

The most intense public debate on the Tehri dam has centred around the issue of seismicity and dam safety. The focusing of public attention to the high degree of uncertainty in knowledge and divergence in scientific opinions on the seismicity issue, is the most significant contribution of the public campaign against the Tehri dam. For many urban environmentalists in India, notwithstanding their own water and power-intensive lifestyle, building up on the scenario of a possible post-dam-burst holocaust has become another topic for sensationalising the anti-dam campaign. This does not, however make the issue less important. The credit of so eloquently articulating the need for an interdisciplinary evaluation of the Tehri dam, specially on the seismic risk issue, goes to Gandhian social activist Sunderlal Bahuguna who went on an indefinite 49-day prayerful fast in 1995 demanding this wider review of the human, environmental and safety aspects of the dam. In the history of environmental movements, the anti-Tehri dam campaign will remain as one of the most important professional contributions of social activists to the advancement of the methodology of environmental impact assessment of big dams in the Himalaya.

The potential of earthquake disasters all along the Himalayan plate boundary has been well known and widely accepted [Khattri 1987]. On the basis of the risk associated with possible damage from earthquakes, the wisdom behind the decision for the construction of big dams in the Himalaya has been questioned [Valdiya 1992, 1993]. 'Concern about seismic safety of dams has been growing in recent years as it has become evident that the earlier pseudo-static design concept is inadequate' [Malla and Weiland 1993]. A debate has been going on for years on the adequacy of the present design of the Tehri dam to sustain the dam against the maximum credible earthquake expected in the area. Commenting on the possibility of a dam of similar design being approved in a similar geophysical setting in the US, Brune, director of the Seismological Laboratory of the University of Nevada, US, commented that "there is no chance that a dam of similar circumstances as Tehri dam could be licensed ...in the US." The occurrence of a major earthquake in 1991 in the upper catchment areas of the dam has further strengthened the environmental opposition. Commenting on the seismic risk associated with the Himalayan dams, Khattri (1992) wrote:

> A number of dams have been constructed in the Himalaya during the past 50 years. Since the historical data on great earthquakes is very meagre and their return periods are not well constrained, the hazard to these structures from such earthquakes is uncertain.

Questions about the inadequacy of this knowledge base had been raised by Gupta (1984). Gaur (1993) presents an adequate articulation of the nature of this uncertain knowledge base and lack of systematic data on which structural design of dams could be based with reasonable certainty. Similar uncertainty is expressed by Normile (1995) in the case of building construction. The nature of the diversity of opinion between the engineers and the seismologists is apparent from the two following quotes. Srivastava (1992), professor of earthquake engineering at Roorkee University claims that 'even though various approaches and methodologies for determination of earthquake hazards at a particular dam site have built-in uncertainties, a conservative assessment of seismic evaluation parameters can be made to ensure overall stability and performance of high dams with adequate safety margins'. On the other hand, analysis of the seismic hazard in the Tehri region by Khattri (1995) indicates that the design figure of the peak ground acceleration should be about 0.9g, which is much more than the one used in the present design of the dam. In the same way several other professionals show a lack of confidence in the existing design practices. Comeiro, professor of architecture at the University of California, Berkeley and an expert on the evolution of seismic provisions of building codes confessed that 'the history of the seismic (design) codes is a history of disasters' [Normile 1995]. In the same manner, referring to the damage caused to the buildings by the Northridge and Kobe earthquakes, Mahin, professor of earthquake engineering at the same university commented that 'a class of buildings we had a lot of faith in has been proven pretty dangerous. . .I am very worried about it' [Normile 1995].

The makers of public policy as well as those who would invest in the big dams in the Himalaya need to tread a cautionary approach till more unified scientific view is available. The gathering of more systematic knowledge and data-base for this will need systematic studies spread over a long time-span. Construction of dams, when undertaken in the mean time, will have to ensure increased insurance and a high factor of safety against seismic risks. This will entail higher investment on the projects and may alter the economics of the dams altogether. It is here that the two environmental peculiarities in the Himalaya, of high sediment load and high seismic risks, limit the possibility of taking advantage of hydrological peculiarity of large monsoonic flow in the same region. Under these conditions, decision-making has to be based on a complex inter-disciplinary optimisation and cannot be guided exclusively by hydrological objectives.

The progress of the debate on the Tehri dam will definitely act as a guideline for future decision-making in the case of many

other big dams proposed in the Himalaya. For countries like Nepal and Bhutan, water resource is the most important natural resource from the viewpoint of economics. The focusing of the debate on the seismic risks may extend the debate to a new dimension of upstream-downstream conflict in the region. When both the upstream and downstream areas of the dam fall within one nation-state, as in the case of Tehri, the decision-making process is often influenced more by the economic growth factors at the cost of social and environmental damage factors. However, when the upstream and the downstream areas fall in two different countries, as will be the case for dams all along the southern border of Nepal and Bhutan, this will not be the case. Under this situation, the question of dam safety will then be addressed singularly by the downstream country and governed by international law. This will create an additional factor for the downstream country to influence decisions in the upstream country. Since all the future water management projects will have to depend on te question of storage, the present uncertainties related to the seismic risk from large dams in the Himalaya need to be addressed at the earliest. Otherwise there is a strong possibility that dam issues may become subject of international litigation, the way the Tehri dam issue had been taken up to the Supreme Court of India (TBVSS and Ors vs The State of UP and Ors 1985). Article 27 of the draft article on the Law of the Non-navigational Uses of International Watercourses [Anon 1994] deals with 'prevention and mitigation of harmful conditions'. Floods caused by earthquake damage to a dam is identified as one of the conditions to be dealt with in the article. Unless the uncertain knowledge base on the seismic risk associated with the Himalayan dams is sorted out, the uncertainty may become another major stumbling block for the construction of big dams near international borders. It may be the case that the feasibility of realising the hydrological dream of storage in the Himalayan rivers will be cut short by the seismological realities.

Examples of such limitations imposed on the proposed storage dams in the Brahmaputra basin has been cited by Khan and Miah (1983). Referring to the hydrological possibilities of storing 400 MAF of water in the Brahmaputra basin, they quote from the recommendations of the Geological Survey of India, that 'the Technical Committee on construction of high dams in seismic zones found that only 30 MAF out of a total of 400 MAF – barely 7 per cent – would be available as potential storage in the Brahmaputra Basin'. This is an important instance of geological factors limiting the availability of optimal storage volume, independent of the availability of hydrologically feasible storage sites. When all the factors are adequately considered and a more comprehensive costing undertaken, sustainability of large and safe dams for storing of Himalayan waters will surely demand a much higher investment in the construction, which in turn will enhance the price for water and power. It is clear that liberal international funding for the construction of large dams, that was available in the earlier years, is drying up. The economic feasibility of future large dams in the Himalaya will finally depend on whether the politically powerful downstream economies will be ready to pay adequately higher price for water or power. Himalayan water need not for ever be considered by the downstream plains as a free gift brought in from the upstream areas by colonial laws used by the state.

[Excerpts from paper presented by the author on August 16, 1995 at the 5th Stockholm Water Symposium.]

Family Planning and Fertility

N Krishnaji

Regulating Reproduction in India's Population: Efforts, Results and Recommendations by K Srinivasan; Sage Publishers, 1995; pp 329, Rs 350.

THE Indian population is likely to cross the billion mark by the end of the century. Although the population growth rate has at last begun to show signs of deceleration, it may remain high for many more decades: high enough, according to some plausible projections, to make us the most populous country in the world by the middle of the next century or a little later. That dubious distinction we will attain because in China the deceleration in population growth started much earlier than in India. In this context it is necessary to remember that India was probably the first country to have started a family planning programme. Our experience in the last four decades or so with the population control programmes therefore requires study, especially to understand why they have not been very successful.

Even without much analysis one can say that family planning programmes fail largely because of the complexity of the processes of fertility decline. In particular, a rapid reduction in fertility cannot be engineered through a simple mix of incentive and disincentive policies designed from above. This we know now from recent experiences in several poor countries. Therefore, to understand and assess the prospects of fertility decline, it is not enough to 'evaluate' the design and effectiveness of specific family planning policies; it is necessary also to study the social and economic conditions – at the macro and the family levels – that promote the general acceptance of a small family norm.

In the book under review K Srinivasan attempts to "understand the nature of efforts that have been put into the Indian family planning program[me], the results achieved at state and national levels, and the implications of successful experiences within the country that may help to make the program[me] more effective". This means that the author is looking at the problem from above, from the policy-maker's perspective to find out why specific policies have worked or failed to work and so on. The successful experiences that the author refers to are those of Kerala, Tamil Nadu and Goa, states in which a noticeable demographic transition has taken place and is progressing.

Indeed, the ongoing transition to low levels of fertility has begun at different points of time in the three states and, moreover, available knowledge suggests that the underlying factors were also different. So, a comparative study of the experience the three states will certainly be useful. However, Srinivasan uses an over-simplified and one-sided approach for the purpose. He neatly summarises his study through a picture (p 263) which portray's the differential contributions of the 'top-down' and 'bottom-up' forces to the fertility transition. The top-down forces are: political will, bureaucratic efficiency and IEC services; and the bottom-up forces are: exposure to the west, status of women, high female literacy and low infant mortality. The picture shows that in Tamil Nadu the top-down forces contribute 75 per cent and the bottom up 25 per cent to the transition; the shares are reversed in the case of Goa; and in Kerala the distribution is 50-50. Of course, the author presents this picture for illustrative purposes, but the text which precedes the picture (chapter 7) is no more revealing than the picture.

That is because this all-important comparative analysis is squeezed into one chapter which barely accommodates the facts relating to the transition in the three states. For example, the Kerala case alone has been extensively studied and the debate or 'how it has happened' there is a continuing one. In particular, while female education and empowerment on the one hand and radical and egalitarian politics on the other have been cited as crucial factors, the literature does not suggest autonomous roles to either set of factors; nor does it suggest a neat division of any set of factors into top-down and bottom-up ones. Most importantly, public action in the spheres relevant to demographic transition (for example, disease prevention and control, to mention only one) has had a long history – a history that is not readily translatable into a package of policies for fertility reduction in other states.

In the case of Tamil Nadu, Srinivasan begins with a brief reference to E V Ramaswamy Naicker's 'self-respect movement' of the 1920s and says: "The political advantage emanating from self-respect marriages seems to be the perpetration of the small family norm in Tamil society even before independence". To say the least, there is no evidence to support the statement. Anyway, the author has no time to study 'movements'. He quickly passes on to political will and bureaucratic efficiency, the major factors in his analysis responsible for the recent reduction in fertility. He mentions in this context the noon meals and other nutrition support schemes and refers to the effective communication strategies adopted for the implementation of various government-sponsored schemes including the family planning programme. An example: "... the family planning message now displayed on all public vehicles in Tamil Nadu has come about because of a directive from Tamil Nadu's chief secretary to transport authorities that a message be painted on the rear of every vehicle as a part of the 'fitness certificate clearance procedure' ". Mild coercion for effective communication.

The fact of the matter is that the Tamil Nadu experience (as well as that of Goa) has not been adequately analysed so far to allow for theorising as in the case of Kerala. Superficially it would seem that in Tamil Nadu the Kerala model is repeating itself with a time lag of about two decades. But the differences are quite transparent (for example, the absence of significant land reform in Tamil Nadu). It is of course legitimate to ask how much the so-called populist policies of recent times in Tamil Nadu have actually contributed to the welfare of the common people in a lasting sense and to what extent bureaucratic efficiency has contributed to the success of family planning programmes. However if one wants to chart the course of fertility decline, it cannot be done in terms of the doings of the government alone.

The book under review is however, as said before, exclusively concerned with the actions of governments. Thus, apart from chapter 7 covering the case studies discussed above, the whole book is about policies and programmes pursued by governments, their effectiveness, and so on. The coverage in this respect is quite exhaustive; indeed the author begins the story of family planning perspectives from the pre-independence times and ends it with a reprint of the Draft National Population Policy (1994) of the government of India.

Those concerned with policies and programmes will therefore find the book very useful, but the social scientist interested in the dynamics of fertility decline as a complex social process will gain little.

INDIA'S EUCALYPTUS CRAZE

The God That Failed

N C Saxena

Constituting the only analytical study based on empirical data, this book tests a number of theories associated with the green revolution. It will interest agricultural economists, environmentalists, foresters, international agencies and policymakers.

Conflict and Co-operation in Sou

V S Sheth

External Compulsions of South Asian Politics edited by Shelton U Kodikara; Sage Publications, New Delhi, 1993; p 352, Rs 325.

THE end of the cold war has in a significant way affected international relations. The withdrawal of competing ideological interests of superpowers have been conducive to the resolution of several regional conflicts all over the globe. However, some conflicts have persisted and new ones have come up in the face of growing interdependence of humanity.

The volume under review deals with politics among south Asian countries which have sustained conflicts within and between nation states of the Indian subcontinent despite a transformation in global relations between major powers and their allies during the last few years. The edited work of Shelton Kodikara, former visiting SAARC professor in Delhi University, 1992-93, is rich in overall information and analysis. It contains 16 articles written mainly by scholars from south Asian countries and various documents and agreements concluded between India and its neighbours Sri Lanka and Nepal. The writings are comprehensive and deal with the subjects such as the major external powers' interests, the south Asian reactions to the crisis in the Gulf and internal problems faced by south Asian countries.

Reviewing the writings of various scholars one finds that authors differ in their understanding and approach to the problems of the region. The basic premise of Rasul Rais' article is valid. He states that the south Asian sub-system is Indo-centric in character; states of the south Asian region have not achieved optimal levels of political integration and the state interactions in the region are a mix of co-operation and conflict. Pervaiz Cheema substantiates the point of India's dominance when he states (p 49) that all south Asian states except Pakistan have informal region security systems with India. Rais (pp 24 and 27) says: "In Pakistan's case the basic drive to search for alliances came from the regional threat milieu" and "motivation for a middle power status would continue to guide and inspire Pakistan's regional and international agenda". While one cannot dispute the ambitions of Pakistani elites to gain the status of a middle power, the desire to integrate itself in military alliance with the west originated after the Pakistani ruling elites in the early days of independence were thwarted by Indians in annexing the weak, defenceless autonomous territory of Maharaja of Jammu and Kashmir. Muni in his article states that the rhetoric of containing communism in the post-world war period provided a basis for US policy-makers to set up structures of military alliances in Asia, and that India was not persuaded to join the western alliance system in the 1940s and 50s as it was considered weak, unstable and on the verge of disorder, and therefore, incapable of providing leadership to the south-east Asian countries in the struggle against communism.

Rais (p 25) professes that the instability in the south Asian sub-system and the resultant amenability and vulnerability to the intrusiveness of the global system has been due to India's struggle for a role as a regional power and the efforts by Pakistan and other smaller powers to maintain autonomous and sovereign existence. These assertions, like the earlier ones, do not square up with the facts of history. The bureaucratic-military leadership in Pakistan had during 50s and 60s ruled the country with the western support and it was their contempt for domestic legitimacy which resulted in the gross abuse of power. India and Pakistan engaged in three armed conflicts which led to the independence of east Pakistan in 1971. As a consequence of this the global security system intruded the region insofar as India had to safeguard its security and political interest in a conflict with the west-supported Pakistan. Indeed, India would not have suffered at the hands of Chinese in the early 1960s, if it had taken its regional hegemonic role seriously after independence.

S D Muni in his paper explains the relationship between the competitive globalism of the US and its fluctuating interest in the south Asian region. He maintains that the shift in the US-south Asian relations is likely to be maintained and enhanced in the post-cold war and post-Gulf war situation. He is further of the opinion that US policy-makers in their anxiety to safeguard US strategic gains underestimated the complexity of the Kashmir dispute which is deeply embedded in the subcontinental history and psyche.

Pervaiz Cheema outlines four major issues, namely, Kashmir, nuclear weapons, periodic domestic upheavals and the presence of external influences as responsible for generating ill-will, between India and Pakistan. As regards the Kashmir dispute, Cheema's solution to Kashmir problem (p 51) may appear unacceptable to the objective observer of the scene. The writings of Kodikara, K R Singh, Bikram Shah, Leo Rose, Amol Jayawardene effectively portray internal and external pressures under which south Asian states conduct their bilateral and multilateral relations.

It cannot be gainsaid that the high degree of political tension in the region has made the process of community formation and the promotion of a common regional identity difficult and complex. Institutionalisation of SAARC would definitely strengthen the regional identity of south Asia and promote the process of interconnectedness among member states. With the transformation of dynamics and structures of major power rivalries, the global system has changed. However, the impact of global change on regional goals and rivalry between India and Pakistan has been marginal. As there is no attitudinal and institutional change in Pakistani political set up, the rise of fundamentalist and terrorist forces in the vacuum created by the disappearance of competitive globalism of superpowers has been taken full advantage of by Pakistani ruling elites to create disturbances and chaos in the neighbouring Indian border states. The evidence of lack of change in perception of Pakistani elites is provided by Cheema (pp 46 and 47), when he states that India has not accepted the birth of Pakistan and resolved issues arising out of the partition process peacefully. Forgetting the chain of events in the early days of partition, he asserts that the Kashmir dispute is a constant reminder of Indian highhandedness, and also an evidence of broken pledges and Indian duplicity. With the help of post-independence history of relations between India and Pakistan, it can be however asserted that the successive ruling Pakistani elites, inheriting the pre-colonial and colonial legacy of communal cleavages in the Indian subcontinent have been unable to replace the imperialist or expansionist urges with that of peace and co-operation.

It is to the credit of Shelton Kodikara that while editing the volume he is careful not to put the writings of various scholars into a value-based single theoretical framework and this in turn has made it an useful reference material and subject of lively debate. Students of south Asian politics in particular and international relations in general may be advised to be careful in identifying national prejudices of the scholars from objective facts and analyses reflected in the writings of various south Asian scholars.

Water, Sanitation and People's Response

Rajesh Kumar

Studying Hygiene Behaviour: Methods, Issues and Experiences, edited by Sandy Cairncross and Vijay Kochar; Sage Publications, New Delhi, 1994; Rs 325 (cloth).

THE book is a comprehensive work on the dynamics of human behaviour, based on experiences of researchers from different countries Sandy Cairncross, in the opening chapter very rightly proposed that the change in behaviour is more beneficial than providing say 'only improved quality of water'. The review of experiences leads to the conclusion that it is very difficult to measure the simple behavioural patterns which affect factors such as household water consumption. There is a need to develop a set of tools for the operational evaluation of water and sanitation projects.

The literature presented in Section I are based on concept formation, theoretical framework and methodological issues. The importance of qualitative, open-ended and informal introduction with the setting in which behaviour patterns of people takes place has been emphasised. Cultural perceptions or meanings associated with the behaviour also needs to be studied. Stress has been put on the familiarity of the researcher with the cultural setting. Behaviours originate in the varied cultural settings and can interrupt disease transmission. Bateman provides the reader with a framework for defining hygiene behaviour by examining transmission of water and sanitation-related infectious diseases by developing an index of transmission pattern Behavioural intervention is needed at two levels, primary and secondary. Primary barriers prevent infectious organism from entering the environment and secondary barriers are to avoid and removed infectious organisms.

Kochar, Seitlyn, Palto and Pederson suggest ways by which behavioural research should be conducted to act in the right direction. Pederson emphasises the need of 'militant' research leading to a revalidation of local knowledge, demystification of research methods, empowerment and genuine participation of people in the research processes. These are the keys to success for fundamental social change. Kendall discussed practical problems related to reliability of the measures of behaviour.

The second section of the book is rather more useful for health educationists and interventionists, i e, people involved in the 'action programmes'. Issues of evaluation of the impact of efforts made by interventionists through education and communication have been discussed. Hubley suggests some measures for evaluation and Herbert suggests ways by which indicators of hygiene improvement can be developed. Quarry has rightly pointed out the role of health educationists in water and sanitation community programmes while both MacCornack and Haggerty suggest that the involvement of people is the first step for any health education programme.

The third section, deals with empirical testing in which qualitative and quantitative techniques have been used. It is based on the field reports and notes from countries of Africa, South-East Asia and Latin America. The experience presented are useful not only for researchers but also for engineers and doctors working in Public Health Departments. The book is useful to health planners as well since it provides information on hygiene behaviour which affects the health of the people to a large extent in this country.

In the concluding chapter Kochar has discussed the problems of organising the work of researchers from different fields in the form of a book. He justified the way it has been done, yet, it would have been better if problems related to the selection of the universe and sample were discussed after the identification of issues and conceptualisation. The techniques of data collection have been emphasised rather than the parameters needed for the evaluation of change in the behaviour. To develop appropriate interventions in a heterogeneous society it is necessary to identify the reasons for behaviour among different sections of the community. Kochar's message is straightforward and clear – that there is a big gap between water supply and water use. People with safe water supply may not use the same for various cultural and social reasons. These reasons must be studied before implementing any water supply programme. To get more meaningful results on the studies of human behaviour a combination of qualitative and quantitative methods is required in different proportions according to the cultural variations of the communities. Participatory approach, i e, participant observation whether extended or short is more appropriate than the interview methods.

There are no two opinions about the effects of hygiene behaviour on health. Researchers who have to cope with the practical difficulties of assessing the hygiene behaviour will find the book enriching.

Structure of Employment as Seen from 1981 and 1991 Censuses

A Preliminary Look

A V Arun Kumar
B P Vani
Vinod Vyasulu

Data on the occupational structure of the population, on the single digit category, have just been released from the 1991 Census. In this paper, an attempt is made to examine the changes in employment at the single digit level between 1981 and 1991 Censuses, for all India and for Karnataka and West Bengal.

They roused him with muffins, they roused him with ice.
They roused him with mustard and cress-
They roused him with jam and judicious advice-
They set him conundrums to guess.
- Lewis Carroll

IN an industrialising economy, going by the vast empirical work of Kuznets (1966, 1974), we may expect the following types of structural change:

(a) The percentage of the population dependent on agriculture should decline over time – the long run. The obverse is an increase in non-agricultural employment over the same period.
(b) The percentage of the population dependent on industry – manufacturing – should increase over this period.
(c) The increase in manufacturing employment should absorb at least a major part of the population released from agriculture.
(d) Within manufacturing, we may expect a shift from household activities to non-household activities, as the latter may be expected to be larger, and to use better technology.
(e) There may be an increase in the percentage of population dependent on services. But, for a country in the early stages of industrialisation, this increase should be less than the increase in manufacturing. At a later stage of development, faster increase in the services sector may be expected.

The 10-year period covered by the 1981 and 1991 Censuses is not long enough for these structural patterns to manifest themselves very clearly. That is accepted. Yet, one may expect to discern some shifts along the directions indicated above. This we seek to do in this paper. For this purpose, we first look into the shift in employment at the all India level. The other detailed elaborations at the desegregated level will be confined to only two states – Karnataka and West Bengal. Here the analysis will be disaggregated up to the district level with the same one digit level of classification.

I
Shift from Agriculture to Non-Agricultural Sector: All India

It is a well established fact that, the sectoral contribution to the total National Product has witnessed considerable shift over time. Accordingly, the structure of employment in the Indian economy has also shifted, but at a rather slow pace.[1] The primary sector is still the major contributor to employment. First of all, we will try to see the shift taking place from the agricultural sector to the secondary and the tertiary sectors of the economy. For this, the sectoral composition of workers has been worked out both for urban and rural areas.

The total rural workforce in the primary sector over the period 1981 to 1991 has come down from 83.35 per cent to 82.26 per cent. At the same time, the rural female population depending on this sector has increased. The percentage increase in rural employment in the primary sector is 18.73 per cent for males and 42.09 per cent for females (Table 1). The picture becomes more clearer if one looks into the compound growth rates in these sectors. Though the total growth in the primary sector is equal to the growth rate of population, the female workers in the agricultural sector increased substantially, while male workforce witnessed a decline compared to the rate of growth of rural population.

Coming to the secondary sector, the total rural workforce employed in this sector has come down from 7.99 per cent to 7.23 per

TABLE 1. SECTORAL COMPOSITION OF WORKFORCE–ALL INDIA RURAL

Sector	1981			1991			Proportionate Change in Employment 1981-1991			Compound Growth Rates of the Workforce 1981-1991		
	Males	Females	Total	Males	Females	Total	Males	Females	Total	Males	Females	Total
Primary	81.69	89.11	83.35	79.80	89.53	82.26	18.79	42.09	24.33	1.79	3.58	2.20
Secondary	8.35	6.78	7.99	7.73	5.76	7.29	12.50	20.13	13.95	1.18	1.85	1.31
Tertiary	9.97	4.11	8.65	12.47	4.69	10.51	52.10	61.41	53.10	4.28	4.90	4.35
Total	100.00	100.00	100.00	100.00	100.00	100.00						

TABLE 2: SECTORAL COMPOSITION OF WORKFORCE–ALL INDIA URBAN

Seector	1981			1991			Proportionate Change in Employment 1981-1991			Compound Growth Rates of Urban Workforce 1981-1991		
	Males	Females	Total	Males	Females	Total	Males	Females	Total	Males	Females	Total
Primary	11.66	23.00	12.03	12.03	22.16	13.34	40.21	48.51	41.92	3.44	4.03	3.56
Secondary	35.60	28.83	32.12	32.12	25.53	31.26	22.68	36.54	24.02	2.06	3.16	2.18
Tertiary	52.73	48.17	55.86	55.86	52.30	55.40	44.04	67.37	46.55	3.72	5.29	3.90
Total	100.00	100.00	100.00	100.00	100.00	100.00						

cent. The percentage change in rural employment was 12.50 per cent for males and 20.13 per cent for females. This shift is low compared to the increase in the rural primary sector employment. In terms of the sectoral composition also, instead of increasing, the secondary sector has witnessed a decline in the rural areas. This is evident from the very low compound growth rates. The secondary sectorgrowth rate is much lower compared to the primary sector and the growth rate in the tertiary sector.

The sector which should have absorbed the rural labour force must then be the tertiary sector. The percentage increase in the employment in the tertiary sector is quite high compared to the primary and the secondary sectors. The increase in the case of rural male workforce was 52.10 per cent and in the case of females the increase was 61.41 per cent, the increase in the total workforce being 53.10 per cent (Table 1). The sectoral composition of the rural workforce in the tertiary sector has increased from 8.65 to 10.51 per cent over this ten-year period. This is evident from the compound growth rate also. The growth rate is very high compared to the population growth rate. Thus, in terms of the proportions the picture is not in accordance with expectations based on the patterns found by Kuznets.

The sectoral composition of urban employment is shown in Table 2. The table shows that the diversification in total urban employment is less significant than the rural employment. Here again, the percentage of workers in manufacturing has shown a decline. Accordingly, the percentage of the workers in the tertiary sector has increased. In terms of the percentage changes the increase in the urban primary sector was 40.21 per cent for males, whereas for females the percentage change was 48.51 per cent. The largest increase may be observed in the tertiary sector. Unlike the rural sector, the compound growth rates of the secondary sector workforce are almost equivalent to the population growth rates. In the secondary sector, the compound growth rates of the female urban workforce has increased by 3.16 per cent compared to the total secondary growth rates of 2.18 per cent. Similarly, the urban tertiary female workforce also witnessed a high compound growth rate. To bring out some of these factors in detail, the available one digit categorywise growth performance is examined (Tables 3A and 3B).

The proportion of cultivators has come down from 55.16 per cent to 51.58 per cent in the case of males and the values in the case of total cultivators are 51.11 and 48.39 per cent respectively. On the other hand, the proportion of total agricultural labourers

9 Other services	6.54	8.97	8.01

has increased from 29.88 per cent to 31.64 per cent (Table 3A). In the non-agricultural sector, the proportion of the total manufacturing has declined.

The percentage change of the proportions given in Table 3A have been worked out; and this has been shown in Table 3B. The total rural agricultural employment has declined by 1.32 per cent. This is mainly due to the decline in the rural male cultivators and the rural workforce in forestry and fishing. The total rural non-agricultural sector witnessed an increase of 6.59 per cent. Among the rural non-agricultural sector, workforce in Trade and Commerce, witnessed an increase of 17.78 per cent, and the percentage increase in other services was 25.91 per cent. The rural manufacturing employment suffered a setback during the last 10 years. The percentage decline in the rural manufacturing is 12.19 per cent. The decline is almost similar for males and females.

Within manufacturing, the observed decline was mainly due to the decline in the household manufacturing sector, the percentage of decline being 29.73 per cent. The increase in workforce in the other than household industry category was only 3.53 per cent indicating, that, only a small share of the workforce going out of rural household industry employment is getting absorbed into the rural non-household sector. This indicates that on the one hand, a decline in the household manufacturing in general is taking place, and on the other, there is a low growth in the non-household manufacturing employment. Thus the diversification is very slow. The very high percentage increase in the tertiary sector, especially other services, indicates that the considerable proportion of the rural workers are shifting to this sector.

The proportions of the urban workforce at the two census points are given in Table 4A.

The proportion of the total urban agricultural workforce increased, while that of the non-agricultural sector decreased during the two census points. In the agricultural sector, the total agricultural labourers showed a higher proportion, while the proportion of the cultivators have declined, that is, 6.05 to 6.69 per cent. Within the non-

agricultural sector, the total urban manufacturing sector witnessed a decline from 29.63 per cent to 25.07 per cent. While the percentage of the share of trade and commerce has increased from 19.87 per cent to 21.99 per cent, that of transport, storage and communication has witnessed a decline from 9.07 to 8.28 per cent.

Coming into the percentage changes (Table 4B), agricultural sector increased by 2.76 per cent. The urban workforce scenario shows an increase over the reference period for the agricultural sector. Since the percentage of people depending on the urban primary sector may be expected to be small, and since this share should be low from an overall development perspective, it need not necessarily be a matter of serious concern All the more so as this share is not a significant amount in urban areas.

On the other hand the point which is important is that the urban non-agricultural sector witnessed a decline of 0.41 per cent. The main reasons are the decline in manufacturing employment and the decline in the workforce in Transport, Storage and Communication. The decline in the manufacturing employment was 15.38 per cent; within this, workforce in household industry witnessed a decline of 36 per cent, whereas the percentage decline of the workforce in other than household industry was 11.13 per cent. When the genderwise distribution is examined, female employment in household industry was found to have declined by 28 per cent, whereas the decline in male employment was 41 per cent. The decline in non-household manufacturing was 3.49 and 11.16 per cent respectively for males and females. This shift is a matter of serious concern because, this indcate that, the diversification to the non-household segement is one of the healthy direction in the upcoming industrial sturcture.

The construction workforce in the urban area has witnessed an increase of 22 per cent and the increase was mainly from the male workforce.

The statewise percentage changes in the sectoral composition of the total rural workforce between the two census points is shown in Table 1.5. Madhya Pradesh, Bihar and Uttar Pradesh have the highest proportion of the rural agricultural employment of the order of 89.20 per cent, 87.40 per cent and 86.76 per cent respectively in the 1981 Census. The order has been shifted to Bihar, Madhya Pradesh and Uttar Pradesh in the 1991 Census. Kerala state has the lowest proportion of the agricultural workforce in both the censuses. The table also shows the percentage change in employment.

The states of West Bengal and Maharashtra have the lowest proportion of agricultural workers in the urban areas according to the 1981 Census (Table 1.6). Andhra Pradesh, Bihar, Haryana, Kerala, Madhya Pradesh, Punjab, Uttar Pradesh and West Bengal recorded an increase in the primary sector. Most of the states experienced a negative percentage of growth in the secondary sector, this is again true in the case of the tertiary sector, with the exception of Kerala.

Shift in Manufacturing Employment: States

This analysis brings out that, the proportion of people in the manufacturing sector has come down at the all India level in the last 10 years. Now we will look into the manufacturing employment by using the same one digit category classification at the state level. The details are available both for the rural and urban India. Table 7 shows a decline in the percentage of the proportion of the rural manufacturing between the two census points. The two states which experienced an increase in manufacturing employment are Gujarat and West Bengal. At the same time, a major part of the decline in manufacturing is from the household industries in all the states. The rural non-household manufacturing witnessed an increase only in Bihar, Kerala, Orissa and Rajasthan. In the case of Gujarat one can say that the increase in manufacturing that has taken place is mainly from the non-household sector of the rural total employment. Thus,broadly, Gujarat is in the expected path of transition within the manufacturing sector.

Coming to urban manufacturing, all the states showed a negative pattern with respect to manufacturing in general and household industry in particular (Table 8). The percentage of the total urban workforce reveals that the decline is more severe for household manufacturing. Even within this, it is serious among females. We have already mentioned that female urban manufacturing employment has witnessed a negative pattern of growth over the 10-year census period.

In the case of males all the states registered a negative percentage for manufacturing, but in the case of females, Bihar, Kerala, and West Bengal performed better. The respective increase were 11, 33.7 and 55 per cent respectively. In the case of Kerala, though the percentage of urban female manufacturing employment has increased considerably, it was not able to compensate for the general decline in the manufacturing employment. In the case of non-household manufacturing, all the states showed a decline both for male and total manufacturing employment. At the same time, the female non-household manufacturing employment recorded an improvement in the states of Gujarat, Karnataka, Kerala, Tamil Nadu and Uttar Pradesh.

II
Structure of Employment in Karnataka

Some of the observations made in the earlier section will be examined here at the state level. For this purpose, we have purposively chosen two states, namely, Karnataka and West Bengal. First we will look into the employment structure in Karnataka, then West Bengal.

The sectoral composition of employment for rural workforce is shown in Table 9. In terms of sectoral composition the Karnataka situation shows a somewhat disturbing picture. In terms of the total rural workforce, the worker share in the primary sector has declined (84.64 per cent to 83.90 per cent); and, instead of recording at least a minor improvement, the secondary sector employment has declined (8.39 per cent to 7.32 per cent). The increase was captured in the service sector. This is similar to the pattern visible at the all India level.

To get a clearer picture, we have worked out the percentage change in the workers in the respective sectors (Table 9) In rural areas, the increase in male employment is 13.04 per cent and the increase in the female employment is 46.55 per cent. In the case of Secondary sector, the increase is 5.17 per cent and 14.36 per cent in the case of males and females, respectively. The proportion of the increase in the tertiary sector is one of the highest, that is, 55.77 per cent of the total. The respective figures for males and females were 52.7 and 74.5 per cent. Thus, in absolute terms, the increase in the workforce is much more in services, than in agriculture. In comparison with the population growth, the percentage change is high in the services, almost equal in the case of agriculture (except females) and much lower in the case of secondary sector.

In the primary sector, the compound growth rate was one of the highest in the case of females and, in the secondary sector, the growth was much lower compared to the rate of growth of population in Karnataka, that is, 1.93 per cent. The service sector captured most of the increase in population. The compound growth rate of the female workforce in tertiary sector was 6.27 per cent.

The proportion of the rural workforce was worked out and is shown in Table 10A. Similar to the all India proportions, the share of non-agricultural sector is showing an increase over time in Karnataka. Though the proportion of manufacturing has declined, the share of non-household industry has increased from 3.32 per cent to 3.97 per cent.

The percentage change in the rural workforce is shown in Table 10B. The agricultural labourers in the rural areas showed an increase of 11 per cent, whereas the rest of the activities in this sector showed a negative trend. In the non-agricultural sector, which has shown positive change in the case of the total, the percentage of female employment is coming down. Within manufacturing, the household industry showed a decline, whereas the non-household industry employment recorded a positive trend in the case of females and the total workforce. Construction has shown a negative growth similar to the total manufacturing. The tertiary sector in general fared better (Table 10B)

The percentage of the rural manufacturing employment as such experienced a decline. The decline is observed mainly in all sections of the workers in the household industry. In terms of the percentages the decline was 40.34 per cent, 72.57 per cent and 54.18 per cent respectively for males, females and total workers. Such a decline, whether it is due to the poor performance of the traditional household industries or not is still a trend which has to be understood. The data for such disaggregated information at the two digit level are not available so far. Therefore, such an exercise has not been attempted. However, we feel that, such a huge decline may be the result of the decline in the traditional industries, which may be due to its inability to compete with the modern sector. This aspect needs further research as a similar decline was observed in most of the states.

The other segment of manufacturing, that is, activities other than household industry,

Total	100.00	100.00	100.00	100.00	100.00	100.00						

showed a percentage increase of 79.07 per cent for females and 19.52 per cent for the total rural workforce as a whole, whereas the male workforce has declined by 1.71 per cent. This brings out the tremendous increase in the rural female manufacturing employment. The construction sector employment as such declined by 1.63 per cent and the decline was mainly due to the fall in the female employment (53.70 per cent). At the same time, the rural male workforce in the construction sector has increased by 12.93 per cent. The other activities which experienced a substantial increase in the percentage of the proportion are trade and commerce and other services.

The sectoral composition of the urban workforce is given in Table 11. Unlike the all India pattern, the workforce in the urban primary sector has witnessed a decline. The decline was compensated by the increase in the urban service sector. In terms of the percentages, the share of the urban primary sector was 15.35 per cent for males and 27.94 per cent for females in the 1981 Census and this declined to 13.77 per cent and 25.03 per cent respectively in the 1991 Census. The tertiary sector recorded an increase from 49.74 per cent for males and 35.68 per cent for females to 52.93 per cent and 42.37 per cent respectively. Accordingly the urban secondary sector declined from 34.91 per cent in the case of males and 36.38 per cent for females to 33.30 per cent and 32.60 per cent respectively. The decline in the proportion of the urban female secondary workforce is very sharp. The compound growth rates reveal that, the change in the primary sector population is just equivalent to that of the population growth in Karnataka. Thus, it is of relief to observe that, at least, a small segment of the increased population has begun to depend on the secondary sector.

The percentage change in the urban workforce is higher for the service sector, especially for female workers. If we compare the rate of growth of population, except agriculture, the rest of the sectors absorbed more workers. Thus, there is a clear diversification from agricultural to the non-agricultural sectors of the state economy at a broad level. Needless to say, this shift is very slow. The proportion as well as the percentages of the urban workforce is given in Tables 12A and B.

In the urban non-agricultural sector, the male workforce and the total workforce as such experienced negative growth in employment. At the same time, livestock and forestry witnessed an improvement in general. Most of the increase in the rural non-agricultural sector was due to the increase in the construction and increase in the tertiary sector, especially trade and commerce and other services.

Districtwise Employment Structure

The proportion of the rural workers at the district level is given in Table 13. Here, the analysis is restricted to the total workers only. The percentage change in the proportions is given in Table 14.

In the case of primary sector, Kolar and Chikmagalur have the highest proportion in the 1981 Census, whereas in the 1991 to Raichur and Hassan districts. The single-digit wise disaggregation is also shown in the table. In the rural non-agricultural sector, as per the 1981 Census, the percentage of manufacturing was higher in Dakshina Kannada, and Bangalore districts, whereas it was less in districts like Chikmagalur, Hassan and Kolar. As per the 1991 Census, the order of the districts with higher proportion remained the same, but among the lower proportion districts, the order has been shifted to Bellary, Hassan and Raichur districts.

The districts which witnessed highest growth in non-agricultural sector are Chikmagalur, Kolar and Bangalore (see Table 14). Within the non-agricultural sector Bangalore is the only district which witnessed an increase in the male manufacturing workforce. The unusual spurt in the percentage of workers in mining and

quarrying need not necessarily be a matter of great attention, as the number of persons depending on this sector as such is negligible. The high coefficient of variation indicates the variation in the percentage of growth across the districts.

Within urban area, Bangalore has the highest proportion of the rural non-agricultural activities in both the censuses. Within urban manufacturing, both Dakshina Kannada and Bangalore have the highest share (41.14 per cent and 37.98 per cent in 1981 Census to 34.62 per cent and 34.49 per cent in the 1991 Census, respectively). Within manufacturing, the proportion of the non-household manufacturing sector is higher in Bangalore according to the two census points

The percentage change in urban total workforce is given in Table 16. The agricultural sector experienced a steep decline in the proportions in Bangalore, whereas the increase was highest in Shimoga. In the urban non-agricultural sector, the percentage change was highest in Darward and Raichur, say, 3.36 per cent and 3.32 per cent, respectively. Chikmagalur and Shimoga witnessed the sharpest decline (Table 16).

Shift in Manufacturing Employment

The figures in Table 17 are the percentages of the proportions to the total rural manufacturing employment. The male household manufacturing workforce showed a decline in all the districts except Gulbarga. In the case of female workforce Belgaum, Bidar, Gulbarga, Mysore, Raichur, Shimoga and Uttar Kannada recorded a positive percentage change. The total household employment is showing a decline in all the districts except Gulbarga and Raichur. Thus, a kind of shift is taking place within the manufacturing employment towards non-

household employment in most of the districts. This is a welcome trend.

Corresponding to the decline in the household manufacturing employment, the manufacturing employment in other than household industry showed a positive change in most of the districts. In the case of males, the percentage change is highest in Dharward and Dakshina Kannada. The only two districts which recorded a negative percentage change are Gulbarga and Raichur. In the case of female employment Belgaum. Bidar, Gulbarga, Mysore, Raichur, Shimoga and Uttar Kannada witnessed negative percentage change of proportions.

The percentage change in the urban manufacturing employment is given in Table 18. All the districts showed negative per cent of change with respect to the male household manufacturing. In the case of females, Chikmagalur, Mandya, Kodagu, Mysore, Raichur, Shimoga and Uttar Kannada showed an increase. The picture is entirely different in the case of non-household manufacturing. The per cent change in terms of male workforce in the urban non-household manufacturing sector showed substantial increase The female workforce also recorded an increase except the districts like Chikmagalur, Hassan, Kodagu, Mandya, Mysore, Raichur, Shimoga and Uttar Kannada.

III
Structure of Employment in West Bengal

Table 19 reveals that the structure of employment in the rural sector has undergone some changes. The proportion of total workers depending on the agriculture sector declined from 77 per cent to 73 per cent. Accordingly, both the secondary and tertiary sector employment has increased,

the percentage change in the latter is more than that of the former. The percentage increase in the total rural workforce was 26.98 per cent, while the secondary and tertiary sector recorded a growth rate of 51.79 per cent and 67.28 per cent, respectively. Thus, the growth in the secondary and tertiary sectors are much higher than that of the percentage increase in the primary sector employment in absolute terms.

The compound growth rates of the sectorwise population reveal that the growth rates are high compared to the population growth of 2.23per cent in all the segments of the rural workforce except primary sector males. The growth rates of female employment are higher in all the sectors. From the table, one can presume that, the proportion of the increase in the agricultural sector is lower and at the same time, at least some proportion of the employment is absorbed into the secondary sector, though tertiary sector is still the major absorber of employment. The absorption of female workforce in secondary sector is one of the highest compared to the rest of the segments. Thus, rural West Bengal is in the expected path of the transition.

The proportions and the percentage changes within the rural workforce are shown in Tables 20A and 20B respectively. The proportion of the workers in the rural non-agricultural sector increased from 22.24 per cent to 26.48 per cent. Manufacturing experienced an increase of 10.44 per cent in the total workforce. Within this, household industry has the highest share, say 6.22 per cent.

The total rural agricultural sector employment has declined by 5.35 per cent in the case of males, 6.06 per cent in the case of females and 5.45 per cent for total workforce. Cultivators showed an increase only in the case of females and the rest declined. A similar decline was noted in activities like livestock and fishing.

Coming to the percentage changes in the rural non-agricultural sector, the increase was of the tune of 18.73 per cent, 20.90 per cent and 19.07 per cent, respectively. The growth in this sector is shared mainly by all the sub-sectors except mining and quarrying, where the percentage of the proportions showed a decline. Within the manufacturing employment, household industry employment recorded a negative growth in the case of males, whereas female workforce and the total workforce as such experienced an increase 49.95 per cent and 19.08 per cent, respectively. On the other hand, rural manufacturing employment in other than household industry witnessed an increase in all segments of the workers. In construction, female employment has recorded a decline: the case of sectors like transport, storage and communications is

Unlike the rural workforce, the structure is entirely different in the urban workforce (Table 21). The percentage change in the urban workforce was 58.88 per cent in the primary sector compared to the 15.85 per cent and 40.09 per cent in the secondary and tertiary sectors. In terms of the composition of the workforce, both the primary and tertiary sectors witnessed an increase. The primary sector urban employment share has increased from 5.36 per cent in the case of males in 1981 Census to 6.50 per cent in 1991.

Similarly, the percentage of female workers and total workers increased from 5.05 per cent and 5.34 per cent in 1981 Census to 6.19 and 6.47 per cent, respectively. The percentage share in the tertiary sector was 51.99, 70.62 per cent and 53. 35 per cent in the case ofmales, females and total workforce. It changed to 55.81, 68.96 per cent and 57.02 per cent, respectively. The change in the secondary sector for the same groups was from 42.64 per cent, 24.32 per cent and 41.31 per cent to 37.69 per cent, 24.85 per cent and 36.51 per cent, respectively (Table 21). The compound growth rates of urban West Bengal brings out a very disturbing picture in the sense that, the secondary sector was able to absorb just half of the population

According to the 1991 Census, the 24 Parganas district was divided into 24 Parganas North and South. To compare this with the 1981 Census, we have clubbed these two districts together.

growth in the urban area in this sector. The primary sector experienced a higher growth compared to the rest of the sectors. The compound growth rates show a very high value in the case of female workers in the primary and secondary sectors.

The single-digit wise information on the proportion of the urban workforce is shown in Table 22A. The proportion as such declined in the urban non-agricultural sector. The decline was mainly in the manufacturing sector and in the transport, storage and communication sectors.

Unlike the rural areas, urban primary sector employment witnessed a positive rate of growth in all categories of the workforce. This is shown in Table 22B. The male cultivators witnessed a percentage change of 29.54, while the percentage change in the proportion of the urban females has remained at -1.62, while their share in the livestock and fishing increased by 30.48 per cent.

The most surprising fact is the negative percentage change in the urban non-agricultural workforce. The decline was basically due to the decline in the share of mining and quarrying, manufacturing and transport and communication. The decline

in manufacturing was the result of the d in the male employment at the household level. On the other hand, employment in the non-household industry declined for all the groups.

Districtwise Change in Employment Structure

The districtwise proportions as well as the percentage change in the total rural employment is shown in Tables 23 and 24.

Within the agricultural sector, W Dinajpur and Koch Bihar have the highest proportion of the rural agricultural employment according to the 1981 Census. In the 1991 Census though, W Dinajpur experienced higher percentage within the districts. Puruliya stood second and the third district in terms of the proportions was Koch Bihar. In the rural non-agricultural sector, the proportion is higher in Howrah according to both the censuses.

To bring out the changes clearly, we have worked out the percentage changes between the two census points (Table 24). In the total agricultural employment, all the districts witnessed a decline, where as in the non-agricultural sector, Howrah and Bardhaman witnessed a decline. Within manufacturing, Howrah and Bankura showed a decline in the total rural employment.

Similar to the above exercise, the proportion of the urban workforce for the two census points is presented in Table 25. In the agricultural sector, Medinipur, Murshidabad, and W Dinajpur districts recorded high preentages in the 1981 Census. This order remained the same in the 1991 Census also. According to the 1981 Census and 1991 Census, the role of manufacturing is higher in Hugli, Howrah and 24 Parganas.

Coming to the percentage change in the urban employment (see Table 26), Agricultural sector as such declined only in a few districts, whereas the urban non-agricultural sector witnessed a decline in the percentage change in all the districts except Murshidabad and Puruliya. This trend is disturbing.

Except Murshidabad, Nadia, 24 Parganas (south and north) and Bardhaman all districts witnessed an increase in the household male workforce. The same is the case with female employment also. The only exception is in the districts of Murshidabad, Nadia and 24 Parganas (north and south). Coming to the non-household manufacturing, the districts mentioned above witnessed a decline in male manufacturing workforce and in the case of female employment, Murshidabad, Nadia and 24 Parganas mentioned above showed a decline. Thus, exactly opposite growth patterns are visible between these districts and the rest of the districts in the manufacturing employment at this level of disaggregation.

Coming to the urban manufacturing employment, though the total workforce recorded an increase in the household manufacturing at the state level, this was mainly due to the high percentage change in the Murshidabad district, the percentage increase was 179 56. All other states experienced a negative growth in the share of household manufacturing employment. In the case of the share of the non-household manufacturing, all the districts, except Murshidabad and Nadia witnessed a positive growth. Thus, the increase in the non-household manufacturing is a healthy trend in West Bengal. Within the manufacturing sector, the shift is a healthy one.

IV
Conclusion

The present analysis of the two states at the one-digit level gives different types of pictures compared to the all India level. Therefore, state-specific studies in this direction are needed. Most of the observations made in this analysis, since they are restricted to the one-digit category, may not give as clear a picture if one looks at a more disaggregated level. At the same time some interesting observations at the broader level are visible from this analysis.

At the all India level, the secondary sector absorbed less workers compared to the primary and tertiary sectors, where as in the urban areas, this absorption is equal to that of population growth. At the one-digit all India category, the agricultural sector did show a decline in the rural areas, where as the change was positive in the urban areas. The Karnataka picture is very much similar to the all India situation at the broader level, whereas the West Bengal situation is entirely different. This is true in the case of urban areas also.

Notes

1 The factors which led to such a shift is a matter of debate. For details see Krishnamurthy (1984), and Deshpande and Deshpande (1985).

2 The migration (for rural and urban) aspect is not taken into account.

CENTRE FOR RESEARCH IN RURAL AND INDUSTRIAL DEVELOPMENT

SECTOR 19A, MADHYA MARG
CHANDIGARH 160 019

Applications are invited for the following posts in the Population Research Centre sponsored by the Ministry of Health and Family Welfare, Government of India at CRRID.

Senior Research Officer: Pay scale Rs. 3700-5700 plus usual allowances.

Qualification and Experience: Good academic career with at least high second class post graduate degree in Demography/Population Studies/Economics/Population Geography/Sociology. Ph.D or published work of equivalent standard with at least eight years teaching/research experience at a senior position in Population Studies/Demography. The job requires extensive field work.

Research Assistant: Pay scale Rs. 2000-3500 plus usual allowances.

Qualification and Experience: Good academic career with at least high second class post graduate degree in Anthropology/Economics/Geography/Population Studies/Psychology/Sociology/Statistics. Those with specialisation in Demography/Population Studies will be preferred. Two years of experience in social science research relating to collection, analysis and interpretation of socio-economic data is desirable. The job requires extensive field work

Application on plain paper specifying the details of age, examinations passed, subjects taken, marks secured, year of examinations, board and university, publications, experience, current employment, references etc. must reach the Honorary Director, **Population Research Centre** at above address within two weeks of publication of this advertisement.

IITs Yesterday and Tomorrow

Amrik Singh

That the IITs have a unique place in the Indian higher education system does not have to be enlarged upon. What needs to be done, however, is to encourage and enable them to break their isolation from the rest of the university system and become active partners in the whole educational endeavour. This does not mean that they have to be like the other universities, but surely there has to be greater interaction between the technical sector and the mainstream sector. Being the strongest unit in the technical sector, the IITs have a special obligation in this respect and it is time they started thinking about it.

I

IT was the N R Sarkar Committee report in 1946 on the post-war prospects for technical education that led to the founding of an innovative technological institute at Kharagpur. Some years later, it was raised to the level of an institute of technology (IIT). Within a few years, four others were established on the same pattern.

This coincided with Nehru's vision of a future India in which science and technology would play a considerable role in development. From the day they were established, it was visualised that these institutes would compare with the best of their kind in the world. That the model taken was MIT at Boston did not inhibit other leading countries of the world from getting involved in their planning and establishment. These included the US, the USSR, West Germany and Britain. Each one contributed a great deal to their establishment and provided technical equipment and faculty in the initial stages. In course of time, each IIT established an independent personality of its own

Though the US helped directly only with the IIT at Kanpur the American influence became all-pervasive for one obvious reason. Most of the Indian faculty – and after a decade or so all were Indian – had been educated mainly at American universities. Even when the Russian or the German influence was strong as it was in Bombay and Madras, respectively, a considerable proportion of the faculty had been educated at American universities. No less relevant was the fact that they were model led on MIT. In consequence, what was happening at American universities strongly influenced what was done at the IITs.

In course of time, more and more IIT students began to go to the US for further study; more important than that, a substantial number of them stayed on. Various surveys have been carried out, and over the years, the general trend was that about 30 per cent of them settled down in other countries. This was the average – for certain IITs (for instance, Kanpur and Bombay) the percentage was somewhat higher. That apart, in certain areas – computers, electronics, for example – the proportion was much higher whereas in areas such as civil engineering it was much lower. This factor further streng-thened the American influence on the IIT system.

How did the IITs perform over the years? This question was gone into by a review committee which reported in 1986. As is usually the case, not much was done in pursuance of what this committee recommended. What the committee recommended was bland enough – indeed, no full-throated attempt had been made to grapple with the basic situation.

The structure of Indian industry had evolved in a particular way over the decades. Without a change of otlook and priorities there, it was not possible either to initiate or to sustain the change of emphasis. Two examples given below illustrate this. For instance, the review committee made the following nine pertinent observations in regard to the working of the IITs:

(1) The undergraduate programmes have tended to become stereotyped although when the IITs were started, the programmes were very flexible. The way practicals are condu-cted is another source of dis-appointment.

(2) The total research output of IITs and the quality of research carried out have not reached the levels expected of them.

(3) Over the last few years the emphasis on experimental research has dwindled. There is a tendency to avoid experimental work.

(4) Though these are institutes of techno-logy, there are relatively few doctorates in technology. PhDs are awarded equally in science-based and engineering-based subjects but few have earned doctorates in technology.

(5) Their contacts with industry are few and far between. There is no substantial technological fallout from the projects undertaken by the IITs or from the results of their research.

(6) The IIT faculty have an ambivalent attitude towards the application of science and technology in rural areas.

(7) The cream of IIT graduates are not available for service in the country.

(8) Not many IITians have become entrepreneurs and job generators.

(9) The IIT values system does not motivate the students to be committed to work in the country which has invested so much in their training.

Not much has been done to correct these problems. This was partly due to the priorities of Indian industry as stated above, and partly to the leadership role that the educational bureaucracy was expected to play. The bureaucracy is hardly the appropriate instrument for change, and yet in the prevalent system it is about the only instrument that the country has. Nothing could illustrate this more than the following observation in the programme of action which was adopted by the central advisory board of education in early 1992:

> In the present situation of global inter-dependence, interaction of institutions in one country with institutions and academics in another country has become inevitable and in most cases desirable. One should not get alarmed with the fear of the so-called brain-drain... (those who go abroad) could, in a way, be treated as a brain bank.

This was stated with reference to the menace of brain drain which had showed no signs of abatement. The 1986 review committee chose to play down the loss of talent to India when some of the best brains in the country decided to settle down abroad, the *'real* brain drain', as put by S P Sukhatme in a book with that title. This concept of a brain bank (a piece of empty rhetoric), which was popularised by Rajiv Gandhi during his regime, found its echo in this 1991 document.

Even though the economic policy was changed in the middle of 1991, its impact on the thinking of policy-makers was minimal, so much so that even when they worked out the draft of the revised policy in the later part of that year, their idiom was in no way different from what it was in earlier years.

Subsequent to changes in the economic sphere, the impact of the market has begun to influence certain trends. Brain drain, for instance, is still a problem, but it is not as acute as it used to be. For one thing, the US during recent years became less receptive to those coming from outside. For another, with the liberalisation of the economy, there is much greater awareness of the fact that, sooner or later, Indian industry would have to stand on its own feet and learn to compete in the international market.

In this connection, one important fact needs to be noted. While there are no firm data in regard to the pattern of employment from those who pass out from the IITs, the general trend may be described as follows. Something like 30 per cent of students migrated to other countries, another 15 per cent went into industry on their own, a somewhat larger proportion was employed by industry, a small proportion (not even 5 per cent in each case) opted to go into teaching, the civil services, etc, and a substantial number, something like 25 to 30 per cent, opted for a career in business management. In fact, an IIT degree became the passport for entry into a business career. Over the years, this trend has become pronounced.

There are numerous stories of how some enterprising IIT graduates chose to go into industry on their own. Most of them have done well for themselves. In early 1995,

some of them got together and organised an exhibition at IIT Delhi to demonstrate what they had achieved. Similar exhibitions are likely to be organised at the other IITs. The more telling part of their contribution is, however, another dimension of their activity. In their outlook and activity, they wish to struggle on their own rather than collaborate with those who come from outside. In plain words, they go in for collaboration only as the last way out. Their first preference is to innovate and to experiment. What proportion of Indian industry is controlled by IIT graduates is anyone's guess. The best informed estimate is that it is in the neighbourhood of 15 to 20 per cent.

Going further, one can say that in a decade from today, it is their contribution which is going to be far more decisive than the contribution of established industrialists who, following the post-1947 tradition, believe in wholesale import of foreign technology. They still wish to continue with the earlier mode of working. The IIT graduates think differently. They feel that they have the capacity and the initiative to be able to venture out on their own. Quite a few of them have succeeded to a remarkable extent, and this is what is providing an incentive to others. One can look forward to a much greater contribution by this section of IIT graduates to India's industry in the years to come, for in terms of initiative and enterprise it is the IIT-trained graduates who could make the most meaningful contribution.

In addition to IIT graduates, this sector contains a certain proportion of graduates from the regional engineering colleges and even some of the other engineering colleges. So much depends upon the quality of enterprise that they bring to bear on what they undertake to do. In a sense, therefore, the future lies with them and not with those who have been importing foreign technology more or less uncritically and who are even now accustomed to that mode of working. If some of these industrialists also begin to show a spirit of adventure and enterprise, within the first decade of the 21st century Indian industry could be more than half independent of foreign technology. Should that come to pass, it would be a considerable achievement.

II

It was against this background that in September 1991 a research project was sanctioned by the department of science and technology to the deapartment of electrical engineering, IIT, Kanpur. The review committee of 1986 had said that if the recommendations made by it are acted upon, "changes will be clear and visible in five years' time". Since most of the recommendations were supposed to have been accepted by the government, it was argued that it was time to review the outcome.

In pursuance of this, a project entitled 'The Role and Impact of Teaching Curricula in Meeting National Needs. A Case Study of the IITs' was launched. The principal investigator was N C Mathur who completed the report about the time he joined the UGC as its vice-chairman. The report has been submitted to the department of science and technology and is in circulation. Though not printed yet, it is important enough to be taken note of, for two reasons: first, the IITs are important in any case, and second, this exercise throws a certain amount of light on the way policy reviews are done and implemented. As already hinted, if there has been a slight change in the situation, this is largely because the industrial climate has undergone a change and not because the bureaucratic apparatus – the policy-makers, the IIT directors, and so on – have given it the requisite push. Even in the years to come, the impetus will come largely from outside. At the same time it must be said to the credit of the Mathur report that it has put a certain amount of responsibility upon academics even within the IITs. This is generally not done; the entire responsibility is put upon the government which, in turn, is a recipe for not doing anything.

How did the principal investigator go about the job? Even though the IITs account for less than 2 per cent of the total number of engineering graduates at the degree level produced in the country, they occupy a unique position insofar as the IITs exert tremendous influence on the whole spectrum of technical education as also the entire range of the industrial sector. In terms of methodology, it was decided to obtain the views and opinions of (a) the alumni of the IITs, (b) the employers of IIT graduates (both in government and industry), and (c) the IIT faculty. Each of the three categories was approached through a questionnaire. The response was not particularly encouraging from the alumni – only 2 per cent of all the IIT B Tech graduates responded. Of the government organisations, 43.7 per cent responded. CSIR laboratories and DRDO laboratories also responded at the rate of 25 and 11.1 per cent, respectively. Private industry responded only to the extent of 14.8 per cent. The most disappointing, however, was the response of the IIT faculty. In Kharagpur, only 14.4 per cent responded whereas in Madras, Delhi and Kanpur the rate of response was 20.2, 2.9 and 2.2 per cent, respectively. In addition, a few interviews with some of the leading players in the field of technical education were conducted.

What emerges from these surveys is interesting. One question asked if the respondent would subscribe to the view that the job of the IITs was to produce students comparable to the best institutes in the world. 16.9 per cent of the alumni agreed with that and so did 13.7 per cent of the faculty; 30.8 per cent of the faculty disagreed and indeed 26.8 per cent strongly disagreed. When it came to the faculty, 41.1 per cent strongly and 25.9 per cent strongly disagreed. This is instructive. There is considerable dissatisfaction with what the IITs are doing but there is no comprehensive perception of what needs to be done. Without going into the details of some of the other subsidiary questions, the basic issues facing the IITs need to be brought into the open.

During their establishment, the one thing emphasised repeatedly was that the IITs should be comparable to the best in the world. That was a laudable objective and every effort was made to live up to this ideal. In terms of resources, equipment, faculty and so on, there was nothing lacking. Each one of the IITs was built according to a specific design and given the very best that the country could afford. In fact, cost was no consideration. Even the choice of the first director in each IIT was almost impeccable. One or two of them did have some idiosyncracies, but for the most part they provided strong and innovative leadership. Not only that, admission to the IITs was such that only the best talent in the country could get entry into them. Within a few years of their establishment, it became the ambition of almost every bright student who opted for engineering to join one of the IITs. All other institutes were below them in terms of facilities and prestige.

Within a decade of their establishment they came to be seen as more or less comparable to the best engineering institutes in the world. This was recognised not only within India but almost everywhere. When the first graduates came out, quite a few of them went across the Atlantic and sought admission to various American institutes. Because of their basic equipment and the kind of training that they had had, they were lapped up by American universities. As soon as they passed out they were offered jobs in universities and industry. Consequently, most of them started staying on.

Those who came back found that they were, relatively speaking, unsuitable for Indian industry for the simple reason that it was running with more or less obsolete equipment and at a level of technical competence which existed before second world war or hardly later than that. Even in cases where up-to-date equipment had been procured, the only job for an engineer was to keep it running. It was a maintenance job that they had to perform whereas they had been trained for more advanced work including design. Design work was being done in other countries; even the machinery was being fabricated not in India but elsewhere. It was imported into India and installed and that also not in many places. Altogether it was a bleak and dispiriting situation.

Still, quite a few came back and struggled on their own. Those who were self-willed or did not bother much about family ties and such other considerations stayed on, mainly in the US. In any case, everything was favourable there and only a few things were favourable here.

What was at the root of this? In order to remain abreast of the latest in the field of technology, the IITs devised their syllabi at such a level of sophistication that they should not lag behind leading American institutes like MIT. In plain words, what it meant was that the kind of technology with which they were acquainted was of the American brand and level of sophistication rather than what was obtainable in India. Most Indian industry

operated, as already stated, on the plane of pre-second world war technology whereas, at least in the US, things had gone much beyond that. Thus the gap between American technology and Indian technology became wider with every day that passed.

If the IITs had kept in mind the requirements of Indian industry, they would have been more relevant to the Indian situation. But then their training would not have been comparable with the best in the world. That ideal became the overriding objective and the IITs did not hesitate at any stage in regard to the choices that they were making. They wanted to operate at the cutting edge of technology and that meant American technology. A large number of teachers had been trained there. They went there every year or two and renewed their contacts and caught up with the latest in their fields of specialisation. The sum total of it, however, was that IIT-trained engineers became immensely employable in the US whereas they became more and more unemployable in India.

The example of a colleague of mine illustrates this point. Having done his MSc in chemistry, he went to the US under the post-war scholarship scheme in 1946. He received training in distilling for 20 months. When he came back after the partition, he found that except for one factory, all others were operating on the kind of technology that had been developed between the two world wars. After a few months of incessant efforts he got a job in a beer plant which operated on the kind of technology with which he was familiar. Owing to various reasons, typical of our style of working, he could not survive beyond a few weeks and ended up coming back to teaching. What his experience showed was that he was trained for a kind of technology which was not being put to use in India. What was in use was something that he had not learned or mastered. In other words, he was unemployable in India and, not finding a future for himself in the distilling industry, he elected to teach.

This process was repeated over and over again hundreds and thousands of times and in a variety of ways and situations. Meanwhile immigration laws had been liberalised in the US and more and more IIT graduates began to prefer to settle down there. There were others who did not go abroad or chose to come back. Meanwhile a large number of IIT graduates discovered that to do a degree in business management after a degree from IIT was a good combination. Therefore more and more opted for that career.

Beginning with the 1980s, some of them started going into civil services – that also became an attractive proposition. But one thing that not many of them did was to go into industry, because industry was working in such a manner that quite a few of them found themselves misfits. If they were prepared to adjust, they could adapt themselves to the requirements of that level of technology with which they were not acquainted. Given the situation with which they faced, they came to terms with whatever was available.

This was the broad situation when the IIT review committee reported in 1986. Nothing much was done even after the report was submitted though, in principle, a large number of recommendations were accepted. It is only with the economic changes initiated in the middle of 1991 that things began to change. This has not had as much impact on the IITs as it ought to have had. The Mathur committee, nhowever, is a contribution towards such a possible change and it needs to be looked at somewhat more carefully from that point of view.

IV

Even though the objective situation has changed somewhat, what happens within the IITs is a matter of considerable significance. As already stated, even if the IITs wanted to re-orient their curricula they were caught in a bind. They could not be like the other engineering colleges for that would have meant a marked deviation from the MIT model that they had adopted for themselves. And if they followed that model, what they succeeded in doing was to prepare professionals for the American market and not for the Indian market.

Fortunately, now the character of the Indian market is changing. There is not only the desire but also the compulsion to compete in the international market. This in turn would mean that Indian industry has to be up-to-date as far as technology is concerned. In order to be up-to-date there are two choices. One is to enter into collaboration with foreign industry and import their technology. This is the pattern that was followed during the last five decades. The snag in this mode of functioning is that it is not the latest technology which is made available. Instead, it is the technology which has been discarded that is exported. In other words, the latest technology is treated as the preserve of those who invented it. This is what gives them an edge over other competitors even within their own country.

This is the pattern of development in those countries. In the international context, this process is to be seen in the competition that is so very evident in countries such as Germany and Japan *vis-a-vis* the US. These two countries did not depend upon what was being done in the US. Rather they developed their own R and D and made every possible attempt to steal an advantage over the others. This explains, for example, how Japan was able to overtake the US in the manufacture of cars, electronic goods and other innovations such as artificial intelligence, robots, etc.

This brings us to the second alternative which is available to us in India. Unless we can adopt this alternative, what we have will always be second-hand and derivative. By the time we catch up with an advanced country it would have gone ahead. In other words, we would be always one step behind – if not more. Properly speaking, no country has ever been able to progress unless it has become self-reliant in R and D.

It should not be necessary to quote data in regard to how scientific research has been promoted and nurtured in India during the last couple of decades and with what results. The plain fact is that the initiative in scientific research was taken mainly by the science laboratories with funding provided by the government. Before long, the whole thing got bureaucratised and the result is that not much has been accomplished on that plane. A number of people have argued over the years that government control of scientific research is not going to give us that edge over others which we aspire to achieve. Scientific research has to be de-bureaucratised and R and D placed by and large in the hands of private industry, which is motivated by the desire to overtake others.

When we come to think of it, the government got into the business of scientific research because at one stage there was no industry worth the name which could have sponsored research. Now that industry is likely to grow in size and range and resources, the changeover should take place. Some evidence of it is already to be seen.

What we have to do is to give further impetus to this process and make it pick up momentum so that it can compete with others for better resources, both human and financial. This will take time. The next couple of decades are crucial from that point of view. The decisions that are being taken today would shape the way things will happen after some decades. Unfortunately, there is not adequate awareness of the issues or the stakes involved. That is why it is all the more necessary that awareness should be spread not only amongst those concerned but also among the general public.

Whoever else is aware, the degree of awareness that obtains in the university world, including the IITs, is not extensive enough. That is a cause for anxiety. Quite appropriately, this is one area to which the Mathur committee has given some attention.

V

When science laboratories were established, they drew upon the universities for their manpower. There was nothing unusual about this; this is how it happens in every case. But two things happened simultaneously to deplete the human resources of universities. One was the migration of talent to these laboratories, and the other was the migration of talent to other countries, notably the US. This double depletion of talent impoverished the universities to such an extent that for the past few years, universities have not been able to produce men and women of the right calibre in adequate numbers. Even the needs of the research laboratories are not being met as they deserve to be. Simultaneously, with the growth in the number of colleges and universities, resources for the latter in particular became more and more difficult to come by. This process has been at work for several decades and the results are there for everyone to see.

Around one-third of the resources that the UGC gets, for example, are given to colleges for their development. Strictly speaking, even these are inadequate. But as long as the centre has an obligation towards the colleges,

this is not only necessary but also imperative. Another factor also started working and a reference must be made to that also. Owing to the greater visibility and mobilising capacity of those engaged in scientific research, funding for that area of activity went up markedly. In the 1980s, for example, while the UGC outlay went up by around 50 per cent the outlay on scientific research went up by 500 per cent. These details are very well known and do not have to be enlarged upon.

Where do the IITs fit into this pattern? Properly speaking, the IITs should have played a pioneering role as far as new technology is concerned. They failed to do so for reasons that do not have to be repeated. In the bargain, however, they damaged themselves a good deal. The Mathur committee has the following things to say in this regard:

(1) The components of the undergraduate programme which contribute to the student's awareness of the Indian industrial scene, namely, summer training and industrial tours, should be organised with much greater care and effort. Persons from industry should be invited to give lectures in the courses as well as extra-mural lectures.

(2) The IIT faculty should consciously improve their involvement in the industrial scene. This can be done at several levels. There is need to modify some of the reward and incentive systems so that faculty will feel better rewarded for industrial interaction. Recruitment should also take this into account.

(3) There is a need to develop contact with the alumni on a much larger scale than what exists at present. This will contribute to the financial resource position and also lead to greater industrial interaction.

(4) There is a need to increase the availability of Indian authored text and reference books for every subject, this should be taken up as a mission with proper planning, incentives and financial gains. This will go a long way in generating confidence in the students in the calibre of the faculty and also provide an 'Indian perspective' to the teaching of engineering.

(5) Student evaluation of courses and teachers is a well-recognised procedure which all well known universities in the world use for improving their education standards as well for reward/punishment of the faculty. This system has not evolved properly in the IITs although some form of student evaluation is done in some of the IITs in many departments. There is need to develop a well thoughtout system in this regard.

As should be clear, the Mathur committee is seriously concerned about the lack of performance of the IITs. Among other things, it has quoted one disturbing fact from the 1986 review committee report. Most of the PhDs awarded by the IITs are not in the area of technology but in the basic sciences and related areas. The IITs were established mainly to promote the application of science to technology. If that aspect is overlooked, the IIT mandate cannot be said to have been fulfilled.

In this connection, one specific point needs to be underlined. The ideal before the IITs was to produce what was called an engineer-scientist as against an engineer-manager which most other engineering colleges did. In more specific terms, what it means is that IIT graduates have to have considerable grounding in the basic sciences. The traditional pattern in most other engineering colleges is to prepare engineer-managers. They are trained as engineers but they also work as managers. This is not so in every case but that is what generally happens. As against that, the IIT graduates are so well trained in the basic sciences that they form an important component of their training. In IIT Bombay, for example, basic sciences receive 30 per cent of the attention and engineering science 25 per cent; 30 per cent attention is given to professional courses. Altogether, therefore, it comes to 85 per cent, the balance being given to the humanities and the social sciences.

Clearly, those trained by the IITs were not meant to be narrow specialists but men and women who were trained in a wide range of knowledge and who possessed considerable depth in the basic sciences and engineering science. These proportions are not observed in all IITs and there are considerable variations, but the broad pattern is about the same. In Kharagpur, for example, professional courses receive 50 per cent of the attention and humanities and social sciences, only 8.1 per cent. It is for the specialists to opine whether in this case there has not been a serious deviation from the basic norm. On the face of it, it appears that that is so.

It may not be out of place to mention the proportions at MIT: 21 per cent for humanities and social sciences, 25.4 per cent for basic sciences, 20.5 per cent for engineering sciences and 32.1 per cent for professional courses. The AICTE/UGC have also said something in this regard but without being very specific. They have allocated 20-23 per cent to basic sciences whereas engineering sciences and professional courses have been clubbed together within a range of 67 to 72 per cent. Whatever be the details, the fact remains that the IITs were innovative and blazed a new trail in technical education.

VI

Without going into any further details, what needs to be discussed is what the Mathur committee has to say in regard to some of these issues. Regarding one of them, the Mathur committee is strongly critical. What is called summer training and industrial tours are not given the kind of attention that they ought to be given. There is no uniform or satisfactory method for placing students for summer training, nor is there any system of monitoring the training of students. Quite a number of students take summer training in the IIT itself, when they choose to get attached to various sponsored projects. There is little co-ordination between various departments and the student placement office which, formally speaking, has to be in the picture.

While this is disquieting enough, the following set of figures has something to say and needs to be gone into more intensively.

TABLE: ENROLMENT IN SUMMER TRAINING, INDUSTRIAL TOURS, B TECH PROJECT

(percentage)

Institute	Summer Training	Industrial Tour	B Tech Project
IITBombay	98.3	53.8	43.8
IITDelhi	94.2	69.1	50.8
IIT Kanpur	59.4	76.8	45.4
IIT Kharagpur	98.5	63.6	45.4
IIT Madras	25.2	51.2	40.0
Overall	76.7	70.5	46.1

Why is there so much variation in this mode of training? While it is correct that every IIT is free to frame its own syllabus, there has to be a set of certain minimum norms which can be ignored only at the cost of quality. That the IIT Madras should diverge from the others so radically in this regard is a matter of concern. Now that this issue has come into the open, hopefully the proportions would be set right.

There is a more basic question which needs to be raised and answered. Who is responsible for co-ordination? Is it only the IIT council or can some other agency be thought of? The IIT council consists of the directors of the five IITs, and their meeting is presided over by the union education minister. Till recently the AICTE did not have a statutory status and its role was hardly significant. Now that it is a statutory body it has to be given a certain role. What that would be is perhaps yet to be worked out and need not pose such a problem. The real problem is in regard to academic co-ordination. That every IIT should have the independence to decide its own curriculum is correct in principle, but surely there has to be some mechanism whereby two things can be ensured. One relates to compliance with a certain set of minimum norms, and the second relates to how the IITs co-ordinate with one another on the academic plane.

In order to fulfil both these objectives, it is important that, in addition to the job of co-ordination done by the various directors, there should be a parallel mechanism whereby academic co-ordination can take place. Strictly speaking, each director represents his own IIT in respect both of administrative and academic matters. In practice, however, it is only the administrative matters which come up for consideration and the academic matters do not receive adequate attention. This lacuna needs to be taken care of.

What if each IIT senate were to nominate four or five members to this body which would do academic co-ordination? The directors may nominate one out of themselves to preside over such meetings for a period of, say, two years. The secretarial work should be done by the office of the chairman though there could also be a vice-chairman elected from amongst the members. Perhaps a tenure of two years for this body would be in order. This body should do two things. One is to lay down the norms below which no IIT should fall. There should be a range within which they can operate. They need not adopt a bureaucratic approach; instead some kind

of flexibility should be built into the system. Second, it is important that such norms be evolved and adhered to and monitored by and large.

The job of this extended senate co-ordination committee, if one may use this nomenclature, should be to take note of what is being done, consider some of the innovations being introduced and make relevant recommendations. These recommendations do not have to be binding on others, but a certain amount of airing of views, exchange of information, and follow-up would be useful. Such a body has not been brought into existence so far. Going by the data collected by the Mathur committee, it seems logical to think of some such body. Today, it is not even certain that the report is being read around the IITs. It has not even been printed yet. Evidently, there is not much of a demand for it.

In any case, going by the response of the faculty, two things may be said. One is that there is a certain degree of apathy on the part of the faculty in regard to the direction in which they are going. Not all of them feel involved in what has been happening, nor do all of them take any initiative to ensure some kind of co-ordination. Second, which is perhaps equally true, this apathy is not so much personal as social in character. Most of the faculty are busy with their work and are on the whole productive. But when it comes to interacting with others, forging social and academic sanctions, and going ahead with the re-orientation of the IIT functioning, not many of them show any initiative or concern. This is a cause for anxiety and represents the same degree of civic unconcern as is to be found amongst teachers in the mainstream universities.

Perhaps nothing illustrates this unconcern more decisively than the way interaction with industry has been neglected. A good deal is being talked about it. With the change in the outlook of Indian industry, things are beginning to change. Nonetheless, there has to be some effort from within the IITs also. Something has been said about it by the Mathur committee but it is neither particularly comprehensive nor wide-ranging enough. For example, apart from the review committee's observations that their contacts with industry are few and far between, that committee made a couple of other observations also: (a) "the IIT faculty have an ambivalent attitude to the application of science and technology in rural areas and (b) not many IITians have become entrepreneurs and job generators".

These two criticisms cannot be treated lightly, particularly the second one. The lack of entrepreneurship is a serious problem - it is concerned with the growth of industry in the country in a decisive way. While controls have been relaxed and government management liberalised, there has to be a lot more done before industrial growth can get, say, doubled within a year or two. For the year 1994, the rate of growth is said to have been a little over 5 per cent. Unless it goes up to 7 or 8 per cent in 1995 and 9 or 10 per cent in 1996 and is sustained at that level for the next several decades, the contribution of industry to the GDP would not be decisive enough.

Countries which have made notable progress during recent years, even those in Asia, have had annual growth rates of around 10 per cent, sometimes even more than that as far as industry is concerned. It is only in industry that the rate of growth can be stepped up markedly. When it comes to agriculture the rate of growth can never be that high. Since around 80 per cent of the population depends upon agriculture, a good deal has to be done even on that front. But even when it is successfully done, the rate of growth would never be that high. In the very nature of things it cannot but be slow. It is only by combining the rate of growth both in agriculture and industry that a resonably vigorous rate of growth for the whole economy can be ensured. There is so much more responsibility cast upon industry, therefore, and the IIT graduates have a role to play there.

As already stated, around 15 per cent have demonstrated entrepreneurship. What is required is that this figure should gradually go up and, within the next half a decade, should go up to almost 30 per cent and then to 50 per cent. That alone would justify the enormous investment made in the IITs and the trust reposed in them. A reference has already been made to the qualities of entrepreneurship displayed by IIT graduates who have gone into industry. It is their initiative which is likely to yield impressive dividends in the years to come. But if more of them opt to go into industry, it would give greater impetus to its growth.

The related aspect of not being concerned enough about the application of science and technology to rural areas is also equally important. With the continuing growth of population and hardly any further addition to the availability of arable land, agriculture cannot afford to look after all the people who are even now working in the field. Industrial growth means more and more people moving away from agriculture and getting diverted into industry. While that process would get quickened, as sketched above, it is no less important that agriculture become more and more commercialised and its productivity increased. The productivity of land in China, for instance, is more than twice that of India. If agricultural productivity in India has to be stepped up, the application of science and technology to agriculture is an urgent necessity.

Currently it is only the agricultural universities which have established faculties of agricultural engineering. Why cannot something corresponding to it be established even in the IITs? After all, they would be working in the same area and would have the same thrust. A certain amount of co-ordination therefore would be particularly useful. Hardly any thought has been given to this dimension of the problem. It is time that this item be put on the agenda and a viable plan of co-ordinated activity worked out.

The lack of interest in rural areas is not at all surprising. Almost without exception, those who enter the IITs come from urban backgrounds. For almost half a century, if not longer, higher education has been the monopoly of the middle class. Alienation from the countryside is therefore a part of its cultural baggage and its patterns of organisation. But if the country has to grow and if the interests of the poor who live in rural areas are to be put at the centre of things, concern with what happens in the countryside is imperative. The IITs have an obligation here as much as any other agency in the country.

VII

In its final recommendation, the Mathur committee has given considerable thought to two issues. One relates to re-orientation of teaching at the B Tech level, and the other one is how to involve the faculty more decisively in industry. The exact recommendations are:

(1) A new course of action needs to be adopted to enhance the exposure of B Tech students to the industrial scenario of the country. Various steps in this direction have been suggested by the curriculum review committees of the IITs. These include a well-planned and supervised summer training programme and industrial tours for the students. The quality of the BTech project needs improvement with greater relationship to the actual needs of industry. This can only be achieved if the faculty have greater involvement with industry and the institute as a whole invites more participation from industry personnel through lectures in courses, extra-mural lectures and adjunct professorships. All these are feasible and need only the will to achieve them.

(2) The involvement of faculty in the industrial scene requires a multi-pronged approach. The following are amongst the possible steps:

(a) Incentives to faculty who participate in industrial interaction in one way or the other

(b) Changing the rules regarding sabbatical leave so that greater leave can be utilised for industrial participation.

(c) A tilt towards favouring industrial experience as a desirable qualification when considering candidates for faculty recruitment.

(d) Encouraging consultancy by reducing the amounts that go to the institute as overheads from consultancy income.

(e) Changing rules so that faculty can draw part of their salary from project funds in return for reduced teaching load

(f) Encouraging faculty to start their own industry and providing suitable facilities and benefits (as has already been started in IIT Kharagpur).

(3) The IITs must start a concerted effort at getting top class textbooks written for use in India which emphasise the Indian work environment and developments in India. Some IITs have already started this scheme. However, much greater effort needs to be made with proper incentives and remuneration. This should be considered equivalent to a teaching load and a definite time frame should be set.

(4) IITs must develop a system of student evaluation of both the teaching programme and the teachers. Such systems are widely used in the US and provide an input for faculty assessment as well as course improvement. When used for faculty assessment, they provide both an incentive and a check to maintain standards.
(5) Contact with alumni needs to be increased to encourage financial contributions and increase their participation in the growth and development of the institutes.

As should be evident, the Mathur committee is seriously concerned about re-orienting the work of the IITs and has made fairly meaningful recommendations. There is little that one can say in addition. But there is one thing which perhaps needs to be done. It would help in the long run. This refers to projecting the IITs not as an autonomous sector of activity but as a part of the total educational thrust to prepare for a more industrialised and productive future. In theory, hardly any one can quarrel with this. In practice this requires a re-orientation in the outlook of the union ministry of education.

For reasons both historical and numerical, it is the UGC which has been receiving the greater part of its attention The AICTE functioned all this time as a limb of the government and did not even have a statutory status. Even after it came to have the statutory status, the first five years of its independent existence were virtually wiped out because it was treated as the backyard of the ministry of HRD. The AICTE never came to develop an independent status for itself and it is only since 1993 that it has begun to acquire a personality of its own Regardless of how it has been functioning and is attempting to function, its potential is immense. In course of time it can become as crucial a wing of the ministry of HRD as is the UGC.

Even in terms of numbers, those enrolled in the technical sector are more than half a million. They come from some of the more talented of the student body. To put it no more strongly, the AICTE is so designed that it can, and should, play a very important role in the field of higher and professional education Currently the IITs are not treated exactly as a part of the higher educational system. They function on their own and live in a world of their own. This worked during the last few decades, but to continue with this mode of operation would not be right The IITs have to be much more at the centre of things than they have been so far

In terms of the statutory relationship between the AICTE and the IITs, a kind of convention has grown up whereby the IITs function entirely on their own. Till recently it was the union minister of education who also presided over the destiny of the AICTE. Now that phase is over, a new equation would have to be worked out. It is not necessary to suggest that the chairman of the AICTE should also become the chairman of the IIT Council; perhaps that would be going too far. But some kind of reorientation would have to be worked out. This should be on the basis that both the UGC and the IITs work under the overall supervision of the ministry of HRD and each one play a role which is central to the task of building a new India.

That the IITs have a unique place in the Indian context does not have to be enlarged upon. What needs to be changed, however, is that they are both encouraged and enabled to break their isolation from the rest of the university system and become active partners in the whole educational endeavour. This does not mean that they have to be like the other universities, but surely there has to be greater interaction between the technical sector and the mainstream sector. Being the strongest unit in the technical sector, the IITs have a special obligation in this regard, and it is time that they started thinking about it.

What do the preceding remarks precisely mean? The answer is two-fold. One, the IITs have the status of institutes of national importance and for all practical purposes they are regarded as universities. They award degrees and function like any other university. Whether they are to be equated with universities or not was gone into by the Association of Indian Universities in the early 1960s when they were set up. There were some reservations regarding government control over the IITs. After a certain amount of discussion, it was agreed that the IITs are like any other university and their mode of management and control is a matter of detail To set the record straight, most other universities function less satisfactorily than do the IITs. The latter maintain at least good standards and this is something to be gratified about.

If the IITs are like the other universities, there should be better give and take between them and the rest. This has to be more on the academic plane than anything else. This also means one thing more. In this connection, the MIT model might be recalled. In fields other than engineering and technology, that institution has, at least in a few cases, outdistanced other universities. There is no reason why the IITs cannot do the same. They have departments of humanities also and some quite capable people on the faculty. There is no reason why these departments cannot perform in such a way as to outshine the other universities. Business management is an area in which they can directly compete with other universities. In the field of natural sciences, this is happening to some extent and the same can happen even in other areas.

Here it may not be inappropriate to offer another analogy. What has been said above about the IITs cannot be said for example about the IIMs. There is a certain similarity between the two but the dissimilarities are stronger and more visible. The IIMs have a limited focus whereas the IITs are universities in every sense of the word though their special focus is on engineering and technology. Technology is the application of science and engineering to technical probelms in different areas of activity. To talk of the IITs in this emphatic vein is to underline the point that the IITs have to function as universities and nothing less than that.

This brings us to the second point. Should they start performing better in the related areas, this would not mean that the IITs have fulfilled their basic mandate. Their mandate is primarily to promote technology. What is happening at that level is not satisfactory enough. Without repeating several of the things suggested earlier, it needs to be reiterated that it is when they function in close and productive collaboration with industry that they would reach their full stature. Instead of continuing to borrow, it is time they became self-reliant in the first round and self-propelling in the second round. This is the consummation one looks forward to.

CENTRE FOR STUDIES IN SOCIAL SCIENCES
CALCUTTA

requires for its collaborative ENRECA project a **Post-Doctoral Fellow in Cultural Studies** for a period of three years renewable every year on the basis of performance on a consolidated starting salary of Rs. 5500/- per month plus contingency allowance for research purposes. The scholar will join an ongoing research project on contemporary urban cultural forms and should have proficiency in conducting independent research in the area of film and media studies in India. The applicant must have a Ph. D. in humanities or social sciences. Upper age limit is 40 years. Applications with detailed curriculum vitae may be sent to the Registrar, Centre for Studies in Social Sciences, Calcutta, 10, Lake Terrace, Calcutta - 700029 by **October 31, 1995.**

Municipal Reform in India

Comparative Models and Processes

Abhijit Datta

Municipal government in India is a colonial legacy which underwent very few structural changes after 1947, leading to its institutional marginalisation. The onset of liberalised political culture at the centre by the end of the 1980s resulted in the passage of the 74th Amendment in 1992. This paper discusses the institutional models and management processes of municipal government one year later, and hazards guesses about the future reform process.

MUNICIPAL government in India is a British colonial legacy. Since Indian independence in 1947, municipal government underwent very few structural changes and became subjected to political neglect, leading to its institutional marginalisation. Widespread and prolonged supersession of municipal government became the order of the day. State government bureaucracy was involved in the political tasks of municipal governance as administrators, appointed executives, and appellate and penal authorities in disregard of all norms of local democracy. In spite of the elected nature of municipal government, its status was no different from parastatals in terms of accountability to its administrative department at the state level.

With the onset of liberalised political culture at the centre by the end of the 1980s, attempts were made to confer constitutional status on municipal government in India, resulting in the passage of the 74th Constitutional Amendment in 1992. This accorded constitutional status to municipal government and provided for only a limited period of their supersession. In addition, the 74th Amendment provided for some degree of institutional uniformity, reservation of electoral seats for the weaker sections and women, a desired municipal functional list, creation of planning committees in the districts and metropolitan areas, and appointment of state election commission and state finance commission on the models of their central counterparts. There is, therefore, an attempt to ensure some degree of institutional uniformity of municipal government under the 74th Amendment.

The state conformity legislations, passed within a year of the enforcement of the 74th Amendment (i.e. by May 31, 1994), dealt with the mandated institutional structure of the 'municipalities', leaving the associated management aspects unchanged. With the installation of a new municipal structure and by ensuring the political existence of the 'municipalities', their associated management system would undergo corresponding changes in the coming years.

The municipal management system operates outside the mandated structural reform so that there is a latent contradiction between the reformed institution and colonial-style management practices. These practices would be under pressure for reform from at least four directions: (i) economic liberalisation, (ii) local political pressure, (iii) citizen involvement in local services, and (iv) judicial intervention.

The present paper mainly discusses the institutional models and management processes of municipal government one year after the passage of the 74th Amendment, and hazards guesses about the future reform process in municipal structure and management in the coming years.

Mandated Institutional Models

The 74th Amendment requires the states to constitute 'municipalities' in three categories: (a) 'nagar panchayats' (town councils) for transitional urban areas, (b) municipal councils for smaller urban areas, and (c) municipal corporations for larger urban areas. In addition to the census definition of an urban area, its internal revenue prospects, and other factors relating to its economic and other significance may be considered for municipalisation, except where municipal services are provided by the industries in an industrial township. Ordinarily, the discretionary elements apply to the creation of a nagar panchayat with a population size of 5,000-20,000 along with the consideration of other factors. A municipal council is generally constituted with a population of 20,001-3,00,000, and a municipal corporation is created for a population of over 3,00,000. These size classifications, however, are not uniform across the states.

The implications of a three-level classification of 'municipalities' are that the smaller townships, barring self-sufficient industrial areas, would have to be fully elected, and the various municipal classes could be differentiated in terms of their functions, tax powers, degree and manner of state control, council size, executive system, and staffing pattern. Future uniformity in municipal management would reduce these operational differences among the municipal classes.

Council Composition and Elections

Apart from electoral composition of the municipal councils, the 74th Amendment provides for additional membership from: (a) sitting members of the state legislature and the parliament whose constituencies cover the municipal area; (b) chairpersons of the ward committees of municipal corporations with a population of 3,00,000 and more; and (c) nominated experts without voting rights. While the involvement of the members of the state legislature and the parliament is emulated from the 'panchayats', the creation of the wards committees at the ward and zonal levels in the larger cities is an innovation under the 74th Amendment. This provides opportunities for decentralisation of municipal services and larger involvement of the citizens in municipal affairs.

The superintendence, direction and control of the preparation of electoral rolls for the conduct of municipal elections vest in a single-member state election commission under the 74th Amendment. Municipal legislations contain long lists of disqualifications for eligibility in elections, leaving the actual electoral procedure to be specified under rules or through executive orders. It is desirable to closely follow the method of elections for the parliament and the state assemblies under the Representation of the Peoples Act for the municipal legislations as well.

The 74th Amendment makes reservation of council seats and the post of the chairperson for scheduled castes and tribes, and for women. It also permits additional reservation of council seats for other backward classes. However, the reservation for scheduled castes and tribes is limited to the period specified for them in the constitution for all other purposes. These reservations are identified for specific electoral constituencies and councils and generally remain valid for the entire five years' duration of the councils.

The municipal chairpersons are indirectly elected, except in Andhra Pradesh where direct election is in vogue. However, the manner of the election of the chairperson has no bearing on his executive responsibilities. Since municipal elections are fought on party lines, the chairperson is chosen from the majority party. In the municipal corporations the chairperson is called the 'mayor', who presides over the council; in the municipal corporations of West Bengal the chairperson of the council acts as the speaker, while the mayor heads a cabinet type executive called the 'mayor-in-council'.

Functions and Finance

Instead of specifying the municipal functions, the 74th Amendment indicates, in the attached 12th Schedule, 18 functional areas for possible devolution to the 'municipalities'. These functions do not always correspond to the central, state and their concurrent subjects listed under the 7th Schedule, e g, (i) slum improvement, (ii) cultural promotion, (iii) urban poverty alleviation, (iv) environmental protection, etc. There is no time limit laid down for devolution of any or all of the functions listed in the 12th Schedule.

There are also significant omissions in the 12th Schedule functions relating to human development – e g, primary and secondary education, basic health care – although these responsibilities are suggested for delegation to the rural panchayats under the parallel 11th Schedule. At the same time, it is up to the state governments to delegate functions for the 'municipalities' beyond those indicated under the 12th Schedule.

Moreover, even when a function or sub-function is delegated to a class of 'municipality', the state government does not vacate its operative jurisdiction from that area, with the result that all municipal functions in effect become concurrent. Even a legal delegation throgh the municipal legislation is paralleled by concurrent functional delegation to state parastatals, or operated directly by the state governments. The real issues, therefore, are two. (a) the need for specifying an exclusive functional list for the three categories of 'municipalities', and (b) the time span for devolution of such functional delegation to them.

The 74th Amendment did not attempt to include a municipal tax list along with the indicative functional list in the 12th Schedule. Instead, the responsibility has been thrust on the State Finance Commission (SFC) to be constituted within a year of the commencement of the 73rd Amendment on the 'panchayats' (i e, by April 23, 1994). The brief for the SFC is much wider than that of its central counterpart which is concerned only with central tax-sharing and block grants. On the other hand, the lack of clarity of municipal functional domain makes it extremely difficult for the SFC to suggest an appropriate municipal tax list and work out the quantum of needed transfers on that basis. The composition of the SFCs are left to the states, and many of them consist of serving civil servants and in one case is headed by the state chief minister. This would come in the way of independent review of their recommendations at state level.

Municipal fiscal structure is characterised by three distinct patterns, viz, (i) predominance of octroi – a municipal import duty – and a subsidiary property tax, with nominal state transfers (Bombay pattern, covering the western and north-western states); (ii) property tax as the major tax, supplemented by entertainment and show taxes, non-tax revenue, and limited state transfers (Madras pattern: covering Tamil Nadu and Kerala), and (iii) property as the main municipal tax and major dependence on state transfers (Bengal pattern, covering the remaining states). These three patterns originally evolved under the erstwhile British presidencies, but now their state compositions have changed owing to the hasty abolition of octroi in recent years (in Andhra Pradesh, Karnataka, Madhya Pradesh, Uttar Pradesh, Himachal Pradesh and Jammu and Kashmir).

Exploitation of municipal property taxes is beset with the problem of frozen valuation base due to rent control; this is sought to be neutralised through a system of presumptive tax with municipal role limited only to tax collection. Their long-term prospects of non-tax revenue is constrained due to attempted privatisation of municipal services under the ongoing economic liberalisation. The future of municipal finances would be mainly influenced by action on three fronts: (a) compensation arrangements for octroi abolition; (b) pace of reforms in rent control; and (c) rationalisation of state transfers.

Planning

The 74th Amendment has provided for the creation of twin planning committees for district and metropolitan areas for finalising municipal plans within their ambit, along with commitment of state and central assistance for the purpose. The committees are supposed to undertake planning for matters of common interest between the 'panchayats' and the 'municipalities', especially planning of physical and natural resources, infrastructure development and environmental conservation. The state governments are supposed to identify the functions for such planning purposes. If these planning functions are more than the municipal revenue functions, then there would be fiscal imbalance by way of maintenance gap with which the SFCs would have to contend. The existing separation of urban development from municipal maintenance tasks may have to be removed either by integrating the urban development and maintenance tasks within

the 'municipalities', or through their municipalisation of urban planning and contracting-out the development tasks to other angencies, both public and private.

The composition of the district and metropolitan planning committees are heavily weighted in favour of the elected members of the 'panchayats' and 'municipalities', to the extent of 80 per cent for the former and 67 per cent for the latter, to be shared in proportion to their population composition. This nullifies the weight of the state (and central) representatives in these committees. On the other hand, since the state (and the central government) will have to commit their assistance for finalising these plans, any existing extra-constitutional planning body at the state or district level will lose its significance for want of resources or irrelevance in the 'municipal sector' plan. In view of this the attempt by some of the states to create separate district urban development authorities (DUDA) may have to be reconsidered.

In future much of the capital finance needed for municipal development would have to be sourced from the market, rather than from the directed credit of plan assistance. For this the 'municipalities' are required to be credit-worthy; to the extent they are not, their development finance requirements would have to be met by way of capital grants. Only the smaller 'municipalities' would be able to justify such plan assistance.

Management Systems and Processes

The nature of the municipal executive is the most controversial area of municipal management. In the municipal corporation the state-appointed municipal commissioner is the executive functionary, while the executive powers are exercised by a triumvirate set of authorities – the council, the standing committee, and the appointed commissioner. The only exception to this arrangement – known as the Bombay model – is the mayor-in-council form of municipal executive in West Bengal, where the executive functionary is the elected mayor-in-council and the executive powers are exercised by another triumvirate – the council, the mayor-in-council, and the mayor.

The municipal councils of the southern states – Tamil Nadu, Andhra Pradesh, Karnataka, and Kerala – follow the corporation type of municipal executive. Elsewhere, the municipal chairman exercises general control and supervision over the chief executive officer acting as the executive functionary, with the exception of West Bengal and Assam where the municipal chairman is the designated executive. In all the municipal councils, the whole council and the statutory standing committees exercise executive powers along with the designated executive functionary. In the nagar panchayats the situation is somewhat unclear, but it is likely to follow the pattern of the municipal councils, except in West Bengal where the chairman would emerge as the sole executive functionary, as in the case of its 'panchayats'.

With the assurance of elective existence of the 'municipalities' under the 74th Amendment, the issue of introduction of a municipal political executive is a matter of time. The nature of such an executive is expected to be of the West Bengal variety of plural executive in the municipal corporations and municipal councils, while nagar panchayats might be left with a single political executive. The American variety of directly elected executive (strong) mayor would be difficult to operate through the complex system of checks and balances between the council and the executive mayor. The traditional English committee system would be out of tune with the politicisation of municipal elections and the tradition of centralisation of the municipal executive functionary in India.

Staffing

Municipal personnel system combines a variety of arrangements, with each set of staff rotating along its specified career path within and outside the 'municipalities'. The managerial posts in the municipal councils and nagar panchayats are filled by either deputed state officials or through statewide municipal cadres. In a few states – notably in Tamil Nadu, Kerala, Andhra Pradesh, Uttar Pradesh, Rajasthan, Haryana and Punjab – these include the municipal corporations as well, barring the post of the municipal commissioner who belongs to the all-India administrative service. A notable exception to these arrangements is Gujarat with a separate system of municipal personnel. The subordinate positions in the 'municipalities' are not covered by any arrangement of centralisation of municipal personnel.

Municipal staffing also poses similar problems as that of the municipal executive in the wake of the pressure from elective 'municipalities'. Once municipal political executives are installed, the accountability of the municipal personnel would have to be linked to them and ultimately to the institution itself. In the process, municipal staffing arrangements may have to be refashioned to underline institutional accountability, unification of grades, lateral entry, and dereservation of posts for particular classes of entrants. A separate municipal service commission for selection of a panel of names for a particular post, and for review of staff grievances, would be necessary for a separate municipal personnel system to operate successfully.

The alternative of a unified personnel system is unlikely to succeed since effective management of municipal personnel is unlikely to be left with the municipal system for staff appointment and their subsequent control. Experiments in installing a unified system of municipal personnel in other countries of south Asia and anglophone Africa since the 1970s have not been successful. In the existing environment of liberalisation and institutional accountability, it is unlikely that the present non-system of municipal personnel will survive for long. This is more so when the 'municipalities' are expected to be enablers, rather than producers, of the bulk of municipal services.

State Control

The conferment of constitutional status and assurance of the elective existence of the 'municipalities' have fundamentally altered the nature of state-municipal relations, even when these operate within the functional and tax domains of the state government. Therefore, in India Dillon's Rule needs to be applied only sparingly and for justiciable reasons. Municipal supersession in future would presumably be permitted on grounds of 'administrative breakdown' comparable to the constitutional breakdown of the states. Consequently, all the subjective reasons incorporated in the municipal legislations

since the colonial days for their supersession would be subjected to judicial scrutiny. The same holds true of all the penal powers assumed by the state governments for municipal 'mismanagement' since the days of non-elective municipal bodies, including that of rescinding municipal resolutions, removal of elected members, issuing directions, approving budgets, deciding on expenditures and contracts, emergency and default powers, etc.

State control of municipal finance is exercised through the state examiner of local fund accounts; in three states – West Bengal, Bihar and Orissa – this operates under the central audit organisation. Municipal audit is conducted from the angle of authorisation rather than that of propriety. These are usually several years in arrears to influence recent financial decisions. Unlike the audit of the central and state governments, auditors of the 'municipalities' can impose surcharge on the municipal functionaries for unapproved expenditures, as in other non-elective local bodies. Future changes lie in the direction of restricting state audit to the state subventions and introducing policy audit for municipal finances in general through an independent local audit commission, as in Britain.

The state machinery for municipal supervision is usually located within the department of urban development. While this department directly deals with the municipal corporations, other 'municipalities' are supervised by its subordinate municipal directorate and the field administrators at the district and divisional (where these exist) levels. State officials interface with the 'municipalities' directly, rather than through the minister-in-charge. With the future introduction of a municipal political executive, such an interface of the state officials with the 'municipalities' would be certainly resented.

For institutional strengthening of the 'municipalities', it might be more appropriate to revert back to the earlier house-keeping department of local government at the state level, rather than supervising local government through two parallel functional departments on rural and urban development. These departments have assumed competing functional responsibilities with the local governments they are supposed to promote and protect. With the unification of such house-keeping responsibilities for local government at the state level, the institutional variants between the 'municipalities' and 'panchayats' are likely to disappear and ultimately a uniform system of local government may emerge.

Public participation

If municipal democracy is to be meaningful, then the "perversely regulated"[1] state-municipal relations in India are to give way to greater municipal autonomy with a downward shift of its accountability to its constituents. Constituency accountability requires greater involvement of the citizens in the activities of the 'municipalities'. The shift from the inter-governmental nature of municipal accountability to constituency accountability would have far-reaching consequences in terms of municipal effectiveness.

In order to make municipal constituency accountability operational, three requirements seem to be necessary: (i) information sharing, (ii) citizens' access to municipal services, and (iii) citizens' involvement in municipal decision-making. The first requirement needs to be ensured through municipal legislations; the second requirement requires specification of citizens' entitlement to municipal services; and the third requirement calls for opportunities of the citizens to participate in decisions for neighbourhood services. The creation of ward committees in the larger 'municipalities' would hopefully provide for citizens' access to, and involvement in, municipal neighbourhood services. It may be necessary to make this mandatory for all the 'municipalities' in the coming years.

There is also a need to incorporate a citizen's charter in the municipal legislations, making municipal services "more responsive and accountable to their clients, improving the quality of service and involving the people in choices".[2] Such a charter specifies both citizen's entitlement and the means to enforce the quality and availability of a paricular service, ensures their market supply, and establishes a redress procedure. Where market forces are allowed to operate to produce municipal services, the consumers would ensure market accountability in terms of their revealed preferences.[3] However, such a market solution of municipal services is presently limited due to the uncertain range of municipal exclusive functions. With the future widening of the municipal functional domain, such market accountability would be an effective alternative to constituency political accountability.

Future Reform Process

At the level of primary stakeholders, future municipal reform would cover the state political leaders, elected municipal councillors, and the municipal voters. Among them, the first group is slated to lose power in favour of the second and third groups. At the secondary level, the state bureaucracy, the protected parastatals, the cadre-based municipal employees, along with their dependent interest groups will lose out, while the future breed of contractual municipal staff and the associated non-governmental service providers would gain in importance. The transition will not be easy or a single-shot operation; the road to municipal reform will be tortuous, conflict-ridden, and long-drawn.

The instrumentalities of the municipal reform process include state-municipal political bargaining, infusion of economic liberalisation in the municipal sphere, and judicial intervention. Of the three, the first would be decisive in the coming years forcing additional doses of municipal structural reforms through future constitutional amendments and legislative reformulations.

MANAGER

Productivity and Source of Growth for Rice in India

A Few Comments

C C Maji
T Haque

IN a recent article Kumar and Rosegrant (1995) claimed that 'research' explained 57.2 per cent of total factor productivity (TFP) growth in rice followed by 'agricultural terms of trade' (18.9 per cent) 'markets' (14.4 per cent), 'PN ratio' (9.9 per cent) and 'canal irrigation' (-0.3 per cent). The study has ostensibly created some myths through its misleading and erroneous conclusions which need to be exploded.

The above results have obvious policy implications; one of which is the need for an increased investment in agricultural research. The authors might have reached the right conclusion even though the methodology used does not appear to be sound.

Following the TFP approach the article attributed any growth in output in excess of the growth in inputs to the growth in total factor productivity. Particularly, research, extension, human capital, infrastructure, price policy, climate, etc, are identified as shifter-variables to explain total factor productivity. So far so good. However, the fundamental flaw starts with the specifications of the variables included in the regression analysis.

Research (RES) has been defined as rice research stock per ha of rice area lagged by five years. The stock of rice research has not been defined in the paper. It is presumed that, following the definition used in a similar paper on wheat [Kumar Pradhuman and Mruthyunjaya 1992] the cumulative number of papers on rice per ha of rice lagged by five years has been used in the regression equation as a proxy variable for Research probably to obviate the difficulty in getting statewise data on investment in rice research. Such a definition implies that if area under rice declines for one reason or the other, the cumulative number of rice research papers per ha will always increase with passage of time. This in turn implies, that *ceteris paribus*, even though there is no additional investment in rice research leading to publication of papers there will be an increase in TFP. Furthermore, a breakthrough in technology/research may be quite adequately documented in a paper or two and breakthroughs are rather rare. Most of the *formal* research papers or at least a substantial proportion of all papers do not have any real research content that can be adopted by rice farmers to increase TFP. Moreover, information/knowledge contained in a research paper cannot in itself generate benefit after five years, but depends heavily on infrastructural and institutional facilities and other shifters. Thus the number of papers on rice per ha of rice is a wrong proxy for investment in rice research.

Extension (EXT) has been defined as extension stock per ha of rice area but fortunately has not been included in the model for multi-collinearity problem.

Infrastructure is represented by markets or more precisely the number of regulated markets per 1,000 ha of cropped area This is also an inadequate specification since regulated markets do not cater only to rice but to all commodities and inputs. The authors are silent about the mechanism used by them to apportion the impact of regulated markets among various crops grown in the regions studied Besides, the number of regulated markets per thousand hectares of cropped area is unable to capture the effects of a more pervasive variable, 'infrastructure'.

Similarly, there is no rationale for using PN ratio as a proxy for the balanced use of plant nutrients in the soil since other plant nutrients (macro or micro) ignored in this specification have equally important role to play in balancing plant nutrients. Moreover, the soil (and hence the crop) will be adversely affected if the doses of nitrogen and phosphorus are greatly increased without altering the PN ratio. For instance, a dose of 60 kg of nitrogen and 30 kg of phosphorus and another of 600 kg nitrogen and 300 kg of phosphorus have totally different effects on soil health even though the PN ratio remains the same.

Agricultural terms of trade (AGTOT) has a general influence on the acreage decision and intensity of input use but little or no effect on shifting the production function up.

The regression model also includes June-August rainfall which coincides with transplanting of paddy. It has, however, ignored rainfall in the month of September and October which is crucial for emergence of panicles and the filling of the grains.

Growths in total input and total output vary over states and even over districts within the state. Aggregation of such divergent areas for regional analysis forces additional errors in specification. For example, Assam, Bihar, West Bengal and Orissa, though geographically close, are very different in agricultural performance and should not be combined to form the 'eastern' region.

The basic data used in this study are said to have been obtained from the Comprehensive Scheme for Study of the Cost of Cultivation of Principal Crops in India, Directorate of Economics and Statistics, government of India even though the data on cost of cultivation of rice for the states of Gujarat, Rajasthan and Maharashtra in the western region and Kerala in the southern region are not reported at all by the indicated source. Besides, data for the period from 1971-72 to 1988-89 for which the TFP and some growth rates have been computed are also not available from DES (GOI) for all the states included in the study. The authors have mentioned that they have filled in the missing data gaps by interpolation on the basis of the trend of the available data. Results based on interpolated (extrapolated) data for a large number of years are not reliable for any serious conclusion since the data are forced to lie in the estimated trendline. All this points to the lack of fidelity and authenticity of data used in the study.

Ten independent variables including two dummies have been used in explaining the variation in TFP of rice. The results presented in the authors' Table 9 show that the coefficients of regional dummies, 'literacy' and 'year' are not significant and the corresponding R^2, i e, the proportion of the total variation in the dependent variable. TFP explained *jointly* by the independent variables is 0.59 or 59 per cent. Thus 41 per cent of the variability in TFP is explained by variables not included in the equation. The standard procedure is to re-fit the equation after deleting the independent variables which do not significantly provide an explanation for the variation in the dependent variable for obtaining the new estimates of the parameters. The R^2 would surely have dropped from its original value of 0.59 as a result of deletion of four independent non-significant variables. More serious is the fact that while computing the share of TFP growth explained by the independent variables the authors have taken $R^2 = 0.59$ as 1.0, i e, 100 per cent in explaining the variation in TFP (ignoring that 41 per cent of the variation in TFP is not explained by the model). Without any correction in the estimated coefficients and R^2 obtained from the estimated equation with only six of the 10 independent variables being significant the authors have computed the percentage share of TFP growth explained by the

significant variables such as the number of research paper on rice per ha of rice area, number of regulated markets per 1,000 ha of cropped area, etc, (Table 10). This distortion has resulted in an inflated contribution of research to TFP.

While computing the sources of TFP growth in rice (Table 10) the authors have totally ignored the independent variable JJARAIN (rainfall in June, July and August) even though its estimated parameter in explaining variation in TFP (Table 9) is highly significant. Thus the estimated contribution of research, market, PN ratio, are upward and AGTOT and canal share in total irrigation are downward biased.

Annual growth rates of real cost of rice production over the period of the study have been shown to be declining in all the regions. This is a debatable issue. Using the same data we have found that the cost per quintal of paddy in 1981-82 prices has declined only in Andhra Pradesh and to a smaller extent in Tamil Nadu. In fact, it has increased in Madhya Pradesh and remained almost the same in the other rice growing states. In other words, input prices considered for computing the cost of production have risen faster than yield of rice in most of the states as well as for the country as a whole.

The computed shares have been used for further analysis biasing the entire conclusion. Even if the initial equation is accepted the share of research paper on rice per ha would have been responsible for explaining (.59 x 57.2) = 33.7 per cent of the variation in TFP.

The authors have used TFP, *variation* in TFP and *growth* in TFP synonymously inspite of their conceptual differences.

No explanation has been provided for a negative growth in TFP in the western region except that 'high variation makes it essentially impossible to measure productivity trends' in this region. This is no explanation as 'high' temporal and spatial variations are observed in the other states too which the authors have pooled together to form various regions of their choice. The negative growth (-0.98) of TFP in the western region should imply a negative contribution of rice research as measured by the number of papers published (on rice per ha). Does it mean:

(a) that research on rice has regional barriers and cannot move across regions within the country as was the case of movement of foodgrains?

or

(b) that the number of papers on rice per ha was too many to adversely affect the growth of TFP?

Since these above implications are not tenable the results suggest some serious mistake underneath the whole analysis.

When the regional dummies in the pooled function (Table 9) are not statistically significant what was the impelling need for continuing with the regional analysis? More importantly, how far are these regional estimates of marginal products (MP) of research stock and internal rate of return (IRR) to investment in rice research valid? Marginal products and IRR (Tables 11 and 12) during 1976-80 were generally lower than those in 1971-75. Why? Is it due to excessive number of papers on rice per ha written during the late 70s than in the early 70s?

These tables also reveal that MP and IRR are increasing in time with the cumulated number of papers on rice per ha. This is all due to a wrong specification of 'research' variable. How could the authors calculate IRR? In other words, where did they get the present value of the stream of benefits (direct as well as indirect) and cost (investment as well as recurring) of rice research to arrive at the staggering figures (Table 12). Why have they not computed the MP and IRR for other explanatory variables such as market, PN ratio, AGTOT, etc, so as to have an idea of the relative role of research *vis-a-vis* these variables?

The benefits of infrastructure, i e, the number of regulated markets and literacy are all-pervading and are not confined to only rice or wheat or any particular commodity. Further, research in rice in one region/country has its impact not only on the same crop and region/country, but also on other botanically similar crops and regions/countries. How are these interdependence, and spillover effects (externalities) taken care of in computing returns to investment in rice research?

The authors have failed to provide a logical explanation for the highly significant negative elasticity with regard to AGTOT (-0.3617). It essentially means that an improvement in AGTOT by 1 per cent will reduce the TFP by 0.3617 per cent whereas a unit per cent increase in research stock, i e, the number of research papers on rice per ha of rice area is associated with 0.2920 per cent increase in TFP. Both the coefficients being highly significant there is a clear trade-off between AGTOT and the writing of research paper on rice. Specifically, a worsening of the AGTOT will increase TFP more rapidly than increase in research stock per hectare of rice. The implication of the result is obvious.

The study reported that "fertiliser use has reached levels where average returns are falling" and the fall is steeper in the eastern region than in the southern and northern regions. The authors have attributed this steeper fall in the eastern region despite a relatively lower level of fertiliser use compared to the southern and northern regions to poor irrigation management leading to faster removal of plant nutrients than their replenishment through chemical fertilisers and organic manures. A moment's reflection would show that, if true, this would automatically lead to a state of declining nutrient status of the rice fields in the eastern region. In order for the average productivity of fertiliser (Y/F) to decline at a sharper rate this would require that the yield of rice (Y) falls at a higher rate than the fall in the nutrient status (F) of the rice soil. But this contradicts reality proving the queer logic underneath the assertion.

TFP has a significant positive elasticity (0.017) with regard to share of canal irrigation in total irrigation (SCANALIRR) which implies that a unit per cent increase in canal's share in total irrigated rice area will increase TFP by 0.017 per cent. With increased exploitation of underground water by means of shallow and deep tubewells and surface water by river lift irrigation, the share of canal in total irrigation has been found to decline at an annual rate of 0.56 per cent. This decline is based on both technical and economic considerations at the present state of irrigation. Specifically, due to the wasteful and uncontrollable nature of canal irrigation the farmers have turned to more controllable groundwater sources for irrigating rice. With a positive elasticity coupled with the declining share of canal irrigation the TFP will decrease over time. Especially in view of the results of the study is it acceptable that more wasteful use of uncontrollable canal irrigation is desirable to increase TFP? In other words, the co-efficient of CANALIRR is expected to have a negative sign implying that as share of canal irrigation in the total irrigation decreases the TFP increases and that a historical decline in the canal's share (0.56 per cent per annum) is consistent with the expected contribution of more controllable non-canal irrigation to TFP growth.

The statement (page A-186) that "with increase in input and technological change, the output has increased by 6.8 per cent annually..." is not correct since the contribution of other shifters included in the regression analysis to increase in output has been safely ignored. Further, the statement on the same page that "variation in TFP is due nearly entirely to variation in output as total input use increased *smoothly* over time" does not go with the growth rates given in Table 8.

In view of the above distortions and deficiencies the results and their interpretations are erroneous and misleading and will not serve any useful purpose.

THE BANGALORE URBAN POVERTY ALLEVIATION PROGRAMME

The Government of the Netherlands and the Government of Karnataka are implementing the Urban Poverty Alleviation Programme in Bangalore (BUPP). It aims at providing an innovative and sustainable model of urban poverty alleviation involving the participation of the urban poor, with special attention for women and children. BUPP is implemented by a Steering Committee which is supported by an executive wing and secretariat in the form of a Programme Support Unit (PSU).

The BUPP programme REQUIRES IMMEDIATELY ON A CONTRACT BASIS FOR 3 YEARS an

EXECUTIVE DIRECTOR (Male/Female)

Will be in overall charge of the programme, will head the Programme Support Unit, and organizes the implementation, monitoring and evaluation of the programme. Should have a minimum of 10 years experience at the executive level in project management and project design preferably in the field of urban poverty alleviation. Should be a dynamic personality. Is experienced in organizing and supervising staff; in administration; and in financial management. Has excellent social qualities so as to be able to deal both with Government officials, NGOs and slum communities. Experience in foreign assisted programmes is an advantage.

Additional requirements are:

1. Experience in the field of developing, implementing and testing urban poverty alleviation strategies and methodologies and readiness to work in slums;
2. Commitment to improving conditions for the urban poor through participatory approaches; Gender consciousness;
3. Knowledge of English and Kannada; knowledge of Telegu and Tamil is an advantage.

Salaries and perks for the post are attractive and commensurate with qualifications and experience. The minimum consolidated salary starts at Rs. 10,000. For further details please contact the Programme Support Unit office of BUPP, Nr. 112, 11th Cross Road, 5th Main, Malleshwaram, Bangalore 560 003 or call 080-364. 047. Fax: BUPP/PSU: 080-334. 61. 85.

Please send your application with full bio-data and a brief write-up on your motivation to apply for the post to the PSU office at the above address. Specify salary drawn and expected, and minimum joining time required, if selected. Candidates already in service of Government/ Quasi Government organisations etc. should apply through proper channels.

Note: These are not appointments under Government of Karnataka.

A FUND FOR INSTITUTIONS

Institutional Investors' Special Fund '95

Minimum targeted dividend of 15% p.a. for the 1st year

Unit Trust of India announces an exclusive scheme-IISFUS '95 for institutional investors looking for an investment providing good returns and easy liquidity

Highlights:

- A 5 year close end scheme open to eligible Trusts including Charitable and Religious Trusts, Societies, Army/ Air force/Navy/Paramilitary Funds and other eligible institutions and Corporate Bodies (excluding companies)
- A maximum of 20% of the funds mobilised under the Scheme will be invested in equities and equity related instruments while the remaining in fixed income securities and money market instruments
- Face value Rs 10 per unit
- Minimum investment - 1 lakh units and multiples of 50,000 units thereafter
- For the first year dividend will be payable on a pro-rata basis in July '96 For subsequent years dividend will be declared before the end of the year and paid on a half-yearly basis
- Option of reinvesting dividend
- Full or partial repurchase will be allowed at NAV based price after one year
- Transfer or pledge allowed after three months from the date of commencement of the Scheme, i e 1st January '96.
- Deduction of tax at source from dividend income as per the Finance Act, 1995

Offer open: 21st August–30th September '95

UNIT TRUST OF INDIA

For your better tomorrow

All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting securities market Past performance is not necessarily indicative of future results. IISFUS-95 is only the name of the Scheme and does not in any manner indicate either the quality of the Scheme, it's future prospects or returns. There is no guarantee that the Scheme's objectives will be achieved. In the event of actual income not being sufficient to pay a minimum targeted return of 15% p a members may suffer loss of unit capital to that extent. Please read the offer document before investing.

WHO BORROWS? WHO LENDS? CHANGING STRUCTURE OF INFORMAL CREDIT

The good earth.
Or leadership that provides the opportunity for new roots in the soil.

The vagaries of nature have for long been the bane of Indian agriculture

A bad monsoon, a failed crop and it's a steep descent into debt

New India, on its part, has always stood by the farmer By providing security through wide ranging and need-based insurance covers.

These have enabled farmers to face the uncertainties of nature with courage and fortitude

Perhaps New India's signal contribution has been in encouraging farmers to switch to lucrative subsidiary activities With policy covers for poultry, pisciculture and horticulture (sugarcane, grapes, chikoos, etc)

Planting the seeds of self-sufficiency. Helping farmers find new roots in the soil

That's what makes New India the leading general insurance company in India

Knowing New India

Sociology of Informal Credit

A study of three green revolution villages in Haryana shows that the informal credit market has undergone considerable change. What are the patterns of debt dependency in the context of the agrarian transformation in the wake of the green revolution and in an environment of increasing availability of institutional credit? How does credit mediate and institutionalise relations among various segments of rural society specifically in the sphere of production and local power structures? **A-123**

Widows

There are intimate links between the predicament of widows and a wide range of patriarchal institutions. The cause of widows must be seen as an integral part of the broader battle against gender inequalities. In the context of social science research, it is right to give attention to widowhood as a particular cause of deprivation. And, in the context of social action, it is right to organise and support widows in their specific demands. **2435**

During the 1980s several states extended social security arrangements, some of which covered the destitute old and widows, the physically and mentally handicapped and agricultural workers. Kerala is one of these states. What degree of security do the scheme provide to the widows? **2415**

Agricultural Liberalisation

What would be the impact of liberalisation of agricultural trade on the growth of the economy? How is welfare loss to be offset? What would be the net impact of liberalisation and such offsetting measures? **A-90**

An economywide analysis of the impact of input subsidies on the fiscal situation, the cropping pattern, the environment and regional equity and on new industries shows that subsidies have become not only unviable but in fact produce a negative impact. It makes more sense to improve the terms of trade for agriculture and step up investment by reducing subsidies. **A-93**

Peace Proposals

The Kumaratunga proposals which attempt to reconstruct Sri Lanka as a union of regions, rather than as a union of peoples, may run the risk of falling between the cracks, satisfying neither the Tamil aspirations for a homeland nor Sinhalese nationalist opinion. **2443**

How Farmers Invest

Contrary trends in public and private fixed capital formation in agriculture have been construed as indicative of a lack of complementarity between the two components of investment. Analysis of recent data does not support this view. **A-103**

Cloistered Memories

While we clearly need to turn to oral history in order to explore women's Partition memories, the tensions in gathering testimony about communal rape and the notion of oral history as a 'recovery' of a past need careful examination. **2427**

Managing Tubewells

West Bengal's experiment in encouraging farmers to take over the management of state-owned tubewells under panchayati raj has been encouraging. **A-117**

Communalisation of Tribals

Hindutva demagoguery has effectively converted the hitherto non-communal tribals of Gujarat into Muslim-baiters. **2416**

Uneven Gains

India's crossbreeding programme has had an uneven impact, partly because of lack of selectivity in applying the technology. While it may have led to an increase in milk production, it has also tended to bring down the availability of draft animals. **A-112**

Blinkered Vision

In contrast to the radial agenda of socio-economic transformation in the 1930s and 1940s, the present movement for Kashmiriyat lacks ideology and vision. **2420**

LETTERS TO EDITOR

Rebel in Saffron

THE contribution of M S S Pandian and Anandhi, 'A Rebel in Saffron' (August 5-12) is moving and memorable. Their earnest efforts to bring out beautifully the stimulating and salutary service of Thavathiru Kundrakudi Adigalar in terms of promoting development and challenging the dragon of communalism to establish social harmony deserve due credit. The writers could have pointed out the truths that the spiritual sage was a child of the age of the scientific and altruistic humanism and his life is a remarkable repudiation of the ridicule directed at theistic humanism that it is sterilising and stifling by students and intellectuals who boast of being ardent admirers and faithful followers of Bertrand Russell and Karl Marx, Jawaharlal Nehru and E V Ramasami Naickar.

Need for Vigilence

I HOPE that the timely publication of the two articles (A K N Reddy and Antonette D'Sa and the other by Girish Sant, Dixit and Wagle, June 17) on Independent Power Projects (IPP) in India will clarify to some extent the misunderstanding, misconception and misinformation about the subject. These articles show that it is not too late to correct wrong decisions, even if that may cause some harm in the near term. Many of the problems the country is facing after liberalisation are a result of suggestions of some foreign financial institutions monitoring the structural adjustment programme of the country. The sequencing of reform of the power sector was not given proper thought and liberalisation was undertaken without giving careful consideration to regulatory aspects of the sector. As a result, different states are taking different routes, the consequences of which will be evident only with the passage of time. Moreover, it appears that the sector is not following any least cost expansion programme, and the capacity additions proposed under the liberalised scheme will not be able to solve the basic problem of the country (that of peak demand in the near future). Additionally, the states unable to attract IPPs may have to bear the brunt of the new system, which may be worth analysing in detail.

At this juncture, it is worthwhile noting that existing private companies have performed well financially, operating under the existing system without demanding excessive concessions. The justification for offering better operating conditions is to be commensurate with the benefits to be derived. It is to be remembered that all private companies (whether local or foreign) are interested in profit making, and it is the duty of the government to check them, and not to offer undue advantage to any particular group. Given the fact that India's electricity demand will continue to grow in the future and the major multinationals will have to come to terms with excess capacities in their countries of origin, it follows quite naturally that there will be increased interest in India sooner or later, irrespective of certain misadventures. This is not to deny the need for reform of the power sector, but reforms need to be well thought out and justified on the overall macro-economic context, and not just to please some people or some institutions. There lies the need for a vigilant local population and the media.

S C BHATTACHARYYA

Grenoble

'German Model'

THE FICCI's willingness to implement 'German Model' for training employees with the training costs being borne by the company itself is a welcome decision. There is a need to view this as a part of vocational education to include the small and informal sectors, micro units, cottage industries, etc, with colleges and other institutions also joining this venture. In certain trades small-scale units can train employees of large-scale units. The new set up should take care to protect the interests of craftspeople.

Craftsworkers are willing to share knowledge among family members, or at the most with the members of the same caste. This is understandable since passing information would jeopardise their economic situation. In fact the origin of intellectual property rights has been traced to craft secrets. Unless their interests are protected, there cannot be a flow of information. This is necessary to upgrade their technology and knowledge and their knowledge can also be of use to big units. The organisation should not be monolith and there should sufficient space for groups to protect their legitimate interests. The structure has to be evolved in consultation with various groups and after weighing the pros and cons of various suggestions.

Some of the existing institutions can be used for vocational education. The corporate sector has to focus on training and research and development. They may be given permission to start a few science and technology universities from the existing universities. There must be a community of teachers teaching various subjects and there must be interactions among engineers, technicians, craftsmen, etc. Some efforts are on to improve the employment potential of ITI-trained craftsmen. West Bengal is implementing a new programme to encourage entrepreneurs among them. This programme can achieve better results if the students are trained under master craftsmen in small enterprises. This would help them gain other skills in running an organisation. Again there are various vocational courses run by department of technical education, ministry of labour and welfare, UGC, private institutions, industries associations, etc. This leads to duplication of effort.

To describe skill requirements in simple terms. In a small unit there is need for persons with multi skill in various junctions of an enterprise. As the size of the unit increases the nutshell component will have less functional areas but the skill component would be higher. As the size increases it would form a functional area into a discipline. With the introduction of flexible manufacturing systems there is demand for multi-skilled persons. All the professional organisations should contribute free cost to these efforts. In Germany engineering professionals conduct craft examinations free of cost. There is an urgent need in India to reorganise, consolidate to synergise the various parts of the systems. They should plant a Banyan tree instead of existing palm tree to ensure a better system.

High-Cost Capital

THE Reserve Bank's credit policy for the second half of 1995-96 is on predictable lines; it advances financial sector liberalisation initiated as a part of structural adjustment and presents monetary policy perspectives and measures guided by monetarism. Not surprisingly, they fail to meet the needs of the macro-economic situation and correct the growing imbalances and inequities. The vast potential for using institutional credit for promoting productive activities and broadbasing the development process is being sacrificed at the altar of narrow ideology.

As part of financial liberalisation, interest rate on term deposits for over two years has been freed, as has that on advances against term deposits beyond Rs 2 lakh, bringing it on par with interest rates on advances in general. The method of valuation of securities by banks for balance sheet purposes and for maintenance of statutory liquidity ratio (SLR) has been made uniform and the Regional Rural Banks (RRBs) have been required to adopt new income recognition norms and exposure limits for borrowers, as applicable to commercial banks. Policies relating to the foreign exchange market and to non-resident investment have been liberalised on the basis of the recommendations of two separate expert/working groups. The limit of Rs 15 crore on overnight open position for each bank has removed and the matter left to individual banks to decide depending on the volume and nature of business and the structure of owned funds, subject to RBI approval and maintenance of additional tier-I capital funds to the extent of 5 per cent of the open position limit. The system of granting general permission for sale of shares acquired under the portfolio investment scheme has been extended to overseas corporate bodies (OCBs); similar general permission has been accorded to sale by NRIs/OCBs of shares acquired on repatriation basis under direct investment schemes and to NRIs for subscribing to the memorandum and articles of association of Indian companies in all permissible activities, instead of only industrial activities as hitherto. Investors will now be able to open foreign currency and rupee accounts and, through such accounts, make investments and repatriate capital, capital gains, dividend and interest income. The limit on refinance against government and other approved securities have been raised from Rs 1,025 crore to Rs 3,385 crore to provide larger liquidity to banks holding excess securities. The maximum interest rate on non-resident (external) rupee accounts has been raised from 8 per cent to 10 per cent for six months to three years. The cash credit component in the maximum permissible bank finance to large borrowers has been further reduced from 75 per cent to 60 per cent, with a corresponding increase in the loan component from 25 per cent to 40 per cent. RRBs have been permitted to lend for housing, subject to a ceiling. The limit on produce marketing loans provided by commercial banks has been raised. Finally, while a minimum period of three days has been prescribed for ready-forward transactions in treasury bills of all maturities and a few dated government securities, banks have been given some flexibility in the maintenance of the minimum CRR of 85 per cent on a daily basis to deal with the problem of frequent holidays.

A majority of these measures are obviously of an 'incremental' nature and do not add up to a significant policy package. They are circumscribed by the primary goal of inflation control, using as tools M3 growth targets (15.5 per cent for 1995-96), the behaviour of the incremental money multiplier (exceptionally low at 1.59 in the current year so far after the already low 2.55 in the previous year) and money market operations. The RBI occasionally refers to the importance of non-monetary factors in influencing price movements, but such a perception plays no role in its policy formulation. That a given target for money supply (M3) combined with the indirect instruments of monetary control such as interest rates and open market operations will somehow generate and transmit credit in sufficient quantities, for the right purposes and at reasonable rates of interest is a myth. There is enough evidence that the transmission mechanism of monetary policy is nowhere near what the authorities expect it to be. So what is needed is a paradigm shift from M3, the money multiplier and money market targets to targets for the size and distribution of credit. What the instruments of indirect monetary control have promoted is a rentier class whose activities scarcely stimulate productive activities in the real sectors.

The RBI continues to be oblivious of the vast diversification of the financial system and persists with archaic notions of aggregate monetary control through the control of reserve money and the use of indirect instruments. To cite the example of 1994-95, scheduled commercial banks provided a credit expansion of Rs 39,270 crore, whereas the disbursements of all the financial institutions was Rs 32,890 crore. Non-financial companies are likely to have mobilised another Rs 10,000 crore of regulated deposits, apart from sizeable intercorporate deposits. Mutual funds other than UTI mobilised about Rs 2,600 crore. Aggregate deposits of the non-banking corporate sector consisting of just 12,350 reporting financial and non-financial companies totalled Rs 2,10,979 crore at the end of March 1994, when the outstanding non-food credit of scheduled commercial banks was only Rs 1,61,488 crore. This financial sector growth is

sucking vast resources of the community and diverting them in favour of a small number of non-financial companies and, amongst financial companies, essentially in favour of rentier activities. The RBI's policies have only reinforced these inequities and distortions. What the situation calls for is a careful monitoring of the end-use of institutional credit by medium and large-scale industries as well as financial companies.

These broader issues apart, even the RBI's review of the monetary and banking scene leaves much to be desired, particularly of bank deposit and credit expansion. In the first place, the RBI's thinking on monetary trends is clouded by the year-end bulge. This is now a perennial phenomenon. If scheduled banks' aggregate deposits bulged up by Rs 20,161 crore (a 6.1 per cent addition to the base of March 31, 1994) in the last fortnight of March 1995 (March 17 to 31), there had been almost an equal bulge of Rs 18,097 crore (a 6.4 per cent addition) in the last fortnight of March 1994 (March 18 to March 31). The year-end bulge gets adjusted in the following weeks, though the process of adjustment may differ from year to year. Besides, it is known that a significant proportion of the year-end bulge is due to the systems of utilisation of funds in the public sector and of interest crediting or debiting on deposit or loan accounts. In such a situation, the tabulation of monetary statistics deserves to be entirely done on March 31 basis, in which case the misleading nature of the underlying monetary trends will get corrected. This is evident from the fact that the increase in M3 between March 31, 1994 and March 31, 1995 at 17.4 per cent turns out to be the same as that between March 18, 1994 and March 17, 1995 at 17.5 per cent. When this is done, monetary growth this year so far at Rs 13,641 crore (2.6 per cent) turns out to be lower than Rs 17,144 crore (3.8 per cent) in the comparable period last year. In fact, the reserve money growth has been considerably lower at Rs 8,599 crore (5.1 per cent) compared with Rs 13,693 crore (9.9 per cent) in the corresponding period last year.

One almost suspects that there is some attempt to create a scare in regard to monetary growth reflecting the authorities' narrow demand management perspective. Though the economy has enjoyed a run of normal monsoons for eight successive years and industrial output is poised for brisk growth, there is an attempt to generate fears about monetary trends based on the rise in net RBI credit to the centre. That central government finances are in disarray and the RBI has been bailing it out cannot be denied. But there are situations when, despite the sizeable monetised deficit, the overall monetary scene need not necessarily seem excessively expansionary in relation to the real growth prospects. In 1995-96 overall trends suggest that M3 growth within the targeted 15.5 per cent, with a good part of even this growth attributable to a possible rise in portfolio investments by FIIs.

This brings us to the third lacuna in the RBI's thinking. However one looks at it, there is considerable sluggishness in deposit growth this year. This was the case last year as well, if the deposit growth attributable to foreign portfolio inflows are excluded. There has been, in other words, a crisis in domestic saving. Aggregate deposits of scheduled commercial banks rose by Rs 319 crore (0.1 per cent) between March 31 and September 15, 1995 as against an increase of Rs 7,637 crore (or 2.3 per cent) in the corresponding period last year. The rise in deposits of Rs 12,538 crore between June 23 and September 15, 1995 as compared with an increase of Rs 13,336 crore in the comparable period of 1994-95 has also coincided with a sudden improvement in foreign portfolio inflows since June. Even so, deposit growth is far below the target of Rs 65,000 crore (17 per cent) set for 1995-96; the year's expansion is unlikely to be more than Rs 45,000 crore (11.6 per cent), the lowest in history. If there is a scare in the monetary and banking scene today, it is over the extreme sluggishness in bank deposit growth with its serious implications for the availability of bank credit, particularly at a time when government borrowing is absorbing sizeable resources from the market. The RBI is merely hoping that deposit growth will gather momentum in the coming months as the secondary effects of the past primary money growth; there is no hope of any acceleration in the primary sources of deposit growth.

From the above angle, the RBI's assessment of recent bank credit expansion is seriously flawed on two counts: first, the expansion has not been as large and fast as has been made out and, second, the RBI's has been silent on the banks' unwillingness to extend to the priority sectors their share of bank credit. The RBI argues that the growth in non-food credit in the current financial year so far "has come on top of an already large credit expansion during 1994-95 which was significantly higher than warranted by the output growth". The increase of Rs 36,029 crore (23.5 per cent) in non-food bank credit between March 18, 1994 and March 17, 1995 or of Rs 37,798 crore (23.4 per cent) between March 31, 1994 and March 31, 1995 took place after the persistent reluctance of banks to extend credit in the previous years. In 1993-94 (on reporting Friday basis) non-food credit expansion had been only Rs 8,272 crore or just 5.7 per cent. It is true that in that year the bigger companies had alternative sources of finance such as commercial paper (CP), large equity and debenture issues and the sudden availability of GDRs and other offshore funds. Among these, the issue of CP has dropped drastically in 1994-95, outstanding CP declining from Rs 4,511 crore in August 1994 to Rs 603.50 crore as of March 31, 1995. There have also been restrictions placed on the deployment of funds obtained through GDRs and other foreign sources.

In a growing economy, a production elasticity of bank credit of about 1.3 is realistic. Therefore, an average growth of about 20 to 22 per cent in institutional credit when the economy has an industrial growth rate of over 8 per cent combined with an inflation rate of 9 per cent seems hardly excessive. This includes credit extended to public sector undertakings (PSUs) which have been starved of funds from budgetary sources. By this yardstick, the rise in credit this year or in the past two years cannot be considered too large. However, what is certainly discouraging is the drastically reduced share of bank credit going to the priority sectors.

Against this background, the RBI's attempts to provide additional liquidity through refinance against government securities and freeing long-term deposit rates so as to assist resource mobilisation by banks do not meet the requirements of the situation. The first measure may help banks acquire liquidity against their excess holdings of government securities, but what about the credit needs of the priority sectors? Some amount of refinance linked to priority sector advances would have sent the right signal to banks. As for the freeing of interest rates on long-term deposits, the overall impact is likely to be adverse. The financial sector developments of the past few years have raised the cost of capital in the economy quite significantly for the government, for public sector infrastructure projects and for private sector enterprises, particularly the small and medium ones. Measures of this nature tend to influence the cost of capital far beyond the marginal amounts mobilised at the free rates of interest. Despite some reduction in the inflation rate, the deposit rate up to two years has been kept at 12 per cent which is a high real rate of return for savers who save in the form of bank deposits. It is now accepted that high interest rates do not augment the overall size of domestic saving, but only shift saving from one instrument to another. In any case, it is sure to be counterproductive as it tends to raise the cost of capital all round. For a while, higher interest rates may help banks to offer some competition to non-banking financial companies and this may in turn help raise banks' subscription to government securities (there is a large backlog of government and PSU borrowing). But in the process the yield expectations of the banks and the market in general will be further stimulated. The government, the PSUs, and private sector borrowers will all have to bear a further addition to their already high costs of borrowing.

'MILK MIRACLE'

Rise of Superstition

THE well organised 'miracle' of drinking of milk by stone images of Ganesha and other Hindu idols in major cities of India which was witnessed recently, apart from suggesting the fully developed network and communication strategy prepared by the

perpetrators of the hoax, also indicates the more ominous trend of the increasing hold of superstitious beliefs on the minds of urban educated people. The crowds which queued up before temples in Delhi, Bombay, Calcutta and other cities to feed the idols consisted of middle class housewives, businessmen, industrialists, bureaucrats, professionals like teachers and lawyers and young college students. These are the people who are supposed to lead India to the 21st century and carry out the fundamental duty (as defined by our Constitution) to "develop the scientific temper, humanism and the spirit of inquiry and reform".

The fact that the 'miracle' occurred on the same day (September 21), and that also only in the major metropolitan cities and towns of India, and a few international capitals like London, New York and other places inhabited by a large chunk of Indian Hindu middle classes (but not in the remote corners of the vast Indian countryside) proves the point made by sceptics that the supernatural miracle could happen only in those places which enjoyed STD and ISD facilities. In other words, the organisers of the 'miracle' could reach their contacts to spread the message of the supernatural, only through the most modern scientific channels of communication. Such widespread and expensive channels could be accessible to no ordinary prankster, but only to well-funded and organised groups, and the needle of suspicion naturally points at powerful godmen with connections, like Chandraswamy, and organisations such as the 'Sangh Parivar'. Incidentally, both have claimed credit for the 'miracle'

But whoever might have brought about the 'miracle' easily shown to be a hoax relying on capillary attraction by which a liquid is drawn along a narrow tube, Ganesha's trunk in the present case – among other similar rational explanations), their main strength lay among the gullible educated Indian middle classes, whether in Delhi or London, whose superstitious minds had no patience to suspend judgment in the presence of any unfamiliar phenomenon, but were impatient and all too ready to accept such events as magical evidence of the spiritual powers of the Hindu deities. Sanction for the middle class frenzy over the 'miracle' was manifest even in most of the national English newspapers, which not only decided to choose the event for their main first page lead the next day, but also allowed some of their reporters to send despatches which betrayed their sneaking belief in the 'miracle'. This was something which could not be imagined in these newspapers even a decade ago. In the recent past, such 'miracles' (usually reported from obscure villages or towns, where one off and on heard of some image of Kali or Durga suddenly becoming 'alive' and showering blessings or curses, on people) were treated in newspaper coverage in the national press with a healthy distrust and humorous disdain. Because of this fear of public ridicule in newspapers, those among the urban Indian educated classes who nurtured superstitious beliefs probably took care to confine their practices within the four walls of their homes, and rarely dared to come out in the open in public displays like the one which we witnessed during the 'milk miracle'.

Another deterrence to such exhibition of 'miracles' in cities in public in the past by the Hindu middle classes could have been a conscious opposition by the Left and secular forces and intellectuals who made determined efforts to demystify such events and reduce the rumour-mongers to a laughing-stock in society. Today such organised efforts to educate the 'educated' urban middle classes in scientific temperament are feeble. The rise of religious obscurantist forces at the helm of political and social agitations in India has relegated to the background efforts at encouraging scientific inquiry and has instead paved the way for the reinforcement of religious superstitions, which are gaining respectability even among the educated. It is not coincidental that a group of Delhi lawyers have decided to sue Doordarshan for carrying an interview with a cobbler on the day of the 'miracle' who in an innocent gesture demonstrated how even the appliance he used for mending shoes could absorb any liquid served to it. The lawyers have complained that this hurts their religious feelings since it compares Ganesha with the equipment used by an untouchable cobbler.

The 'milk miracle' – concentrated in urban India – indicates the gradual retreat of scientific inquiry and its replacement by the recrudescence of medieval superstitious beliefs among the educated middle classes which, disillusioned with secular and democratic ideologies and bereft of any alternative and convincing programmes within those frameworks, are today seeking security and solace in 'miracles' provided by religious charlatans.

BALANCE OF PAYMENTS

'Lost' Transfers

THE Annual Report of the Reserve Bank highlights, and quite rightly, the substantial step up in the surplus on account of the invisibles between 1993-94 and 1994-95, from $ 970 million to $ 1,864 million. Also, it underlines that "the dominant feature in the invisibles account in 1994-95 was the large increase in private transfer receipts, which comprise mainly remittances from Indians working abroad". Private transfer receipts in 1994-95 are estimated at $ 6.2 billion compared to $ 3.8 billion in 1993-94 – no doubt, an increase worth underlining.

The question which immediately arises is why despite an increase in the inflow of private transfer receipts to the tune of $ 2.4 billion, the net increase in the surplus on the invisibles account in 1994-95 was by only $ 0.9 billion ($ 1,864 mn minus $ 970 mn). Where did the balance of the increase in private transfer receipts get dissipated?

The single most important factor which seems to have contributed to the failure of the surplus on invisibles account to reflect fully the increase in private transfer receipts was that while in the past payments on account of transportation very nearly matched receipts on that account (in 1993-94 receipts were marginally larger than payments) in 1994-95 payments ($ 3 billion) exceeded receipts ($ 1.46 billion) by a big margin. While between 1993-94 and 1994-95, payments on account of transportation increased by $ 0.77 billion, receipts declined by $ 0.87 billion. Such a major reversal in regards to transportation should have warranted some explanation. However, the RBI chooses to virtually sidestep it, giving the impression that it saw nothing particularly extraordinary in what had come about in the matter of transportation receipts and payments in the country's invisibles account – which, to say the least, is inexplicable.

It is also noteworthy that between 1992-93 and 1993-94 receipts on account of transportation had registered an increase on 137 per cent, from $ 0.98 billion to $ 2.33 billion, whereas payments on that account increased by 52 per cent, from $ 1.49 billion to $ 2.25 billion. But between 1993-94 and 1994-95, as noted already, exactly the opposite seems to have happened and in the process created an adverse balance of $ 1.56 billion.

The other two heads under which changes between 1993-94 and 1994-95 called for greater elucidation than is forthcoming in the Annual Report are 'miscellaneous invisibles' and 'investment income'. The former, as the report puts it, is a 'heterogeneous category' which, on the receipts side, accommodates 'earnings on international sales of financial and non-financial services' in addition to 'unidentified or wrongly reported transactions' and on payments side accommodates items 'comprising management fees, royalties, rentals, fees for professional services and the like'. Interestingly, items accommodated on the payments side are such as could justifiably be considered investment related, though not, strictly speaking, investment income. Between 1993-94 and 1994-95, investment related miscellaneous payments increased by $ 1 billion (from $ 2.1 billion to $ 3.1 billion) and investment income outgo increased by $ 0.7 billion (from $ 4.3 billion to $ 5 billion). According to the RBI, the former increase reflects 'the liberalisation in the payments regime'. The latter increase is, however, not considered deserving of any explanation, but it obviously is on account of increased external borrowing as also larger outgo on account of dividend and

other payments on foreign direct investment. It should not go unnoticed that whatever increase is registered in receipts from the sale of financial and non-financial services, which presumably include export of software, gets practically totally absorbed by the increased payments on account of 'the liberalisation in the payments regime' or interest charges payable on increased external borrowing, most of which has gone into accumulation of foreign exchange reserves

TOBACCO

Export Syndrome

IN 1993 the Economic and Social Council of the United Nations (ECOSOC) passed a resolution expressing concern about the serious health effects of tobacco use. It also suggested that the economic effects of reducing or eliminating tobacco production in tobacco producing countries needed to be critically examined and viable alternatives evolved. In response to the resolution, the UNCTAD undertook a study on the 'Economic Role of Tobacco Production and Exports in Countries Depending on Tobacco as a Major Source of Income'. The report is an excellent example of how structural adjustment is being facilitated through the efforts of a multiplicity of international organisations.

While the health consequences of tobacco use are of course a major concern, there is no disputing the fact that the crop is of immense commercial importance in many countries. That the UNCTAD should be concerned about the economic effects of a slowing down of tobacco use on developing countries is not in itself surprising. The study in fact reveals interesting facts: Brazil, Bulgaria, China, Malawi and Zimbabwe are the developing countries (the east European countries are included in this category) which have annual exports of tobacco leaf and manufactures of more than $ 300 million. Tobacco accounts for 73 per cent of Malawi's and 41 per cent of Zimbabwe's export earnings and these exports constitute 13.9 per cent and 6.2 per cent of their GDP respectively. Tobacco accounted for 36.8 per cent of agricultural income in Zimbabwe in 1994 and the share is rising. Because tobacco is taxed, it accounts for a significant proportion of government revenues in the major tobacco growing states. The report also details the employment structure in tobacco. In Brazil, for instance, one hectare of tobacco production requires an average 207 worker-days of labour. In Zimbabwe tobacco accounts for one-third of all agricultural labour and 10 per cent of the national labour force.

What is conspicuous in all this is the general assumption that export earnings in these countries are of such significance that nothing, not even the health and environmental consequences of tobacco consumption and, to the tobacco growing countries, of its production, are to be considered important enough to justify curtailing its growth. In keeping with this narrow focus, the report tends to ignore or under-emphasise issues such as the politics of land use, the hold of multinational corporations, the pressure on third world countries to increase export earnings as an important component of structural adjustment programmes, etc. The concluding section of the report refers to the issue of profitability to farmers of growing tobacco. Surveys (sponsored by the International Tobacco Growers' Association) in Brazil and Malawi show that tobacco, in spite of the high costs per hectare, is the most profitable crop, superior to maize, sweet potatoes and beans in Brazil and rice, maize, groundnuts, cotton and wheat in Malawi. Interestingly, the study did not include tea, sugar or coffee, all major export crops. A similar situation exists in Zimbabwe. In other words, on the basis of this one study the report underlines the fact that getting farmers to move away from tobacco would affect their incomes. Even worse is its perception of what a shift of land use from the tobacco crop to traditional food crops would mean. To quote, "more production of the latter [food crops] would need outlets either in more consumption by a country's population, substitution of domestically produced for imports or by exports to foreign markets". To state that "there is scope for improving food consumption" in Zimbabwe and Malawi is to mock at the dire levels of malnourishment and poverty in these and other tobacco exporting third world countries. There is also no mention of the intensive and extensive hold of the tobacco multinationals on the tobacco growing countries and the extent of repatriation of funds which occurs or of the fact that in many of these countries multinationals play the role of absentee landlords dictating the type and variety of tobacco to be planted, the chemicals and fertilisers to be used, the curing methods to be adopted, etc.

Also interesting is the fact that legislation controlling tobacco consumption is being opposed by the powerful US tobacco lobby. In fact under the WTO agreements, nations such as Canada, which have stringent requirements on cautionary notices to be displayed on the packaging of tobacco, are finding that they may become defaulters unless they go slow on tobacco control.

Clearly, if tobacco consumption, which according to an opening statement in the UNCTAD report gives rise to an annual loss of $ 200 billion through mortality and morbidity, is to be curtailed, it has to be delinked from the issue of export earnings. In other words, as long as the compulsions of structural adjustment demand that export industries be given undue emphasis, there will be less and less room for such factors as health consequences of these industries to workers and to consumers everywhere and the environmental impact to determine agricultural and industrial priorities.

POLITICS

In True Colours

THOUGH the Periyar Mela organised by the Bahujan Samaj Party (BSP) failed to draw large crowds to the Parivartan Chowk in Lucknow, it enabled the BSP to reaffirm its distinct ideological identity *vis-a-vis* its supporter, the Bharatiya Janata Party (BJP). This is the second occasion within a span of one month when the BSP has succeeded in having its own way in the face of the Sangh parivar's opposition. In August the VHP had to considerably tone down its proposed programme of 'mahayagnya' in Mathura once the resoluteness of the state government in maintaining law and order became clear. This time, the VHP threatened an 'andolan' against the Periyar mela. Periyar, remembered for his anti-brahminical tirades, had eulogised Ravana, rather than Ram, as the epic hero. Thus the holding of the mela was like adding salt to VHP's wound.

Though the BJP, in lending support to the BSP government, had expected to project a pro-dalit image of the party, the recent chain of events seems to have put it on the defensive. Electorally, the BJP, which already has 51 MPs from the state, is finding it hard to negotiate with the BSP's demand for half of the 85 Lok Sabha seats. Yet, displeasing the BSP in any way might push it towards the Congress or the Samajwadi Party, both of whom are keen to rebuild rapport with the BSP. Secondly, setbacks, such as the Mathura retreat or the Periyar mela, can have a demoralising effect on the BJP's rank and file. The BSP's resolve to restart its caste rallies is going to create hurdles in the way of the VHP's 'ekatmata yatras' beginning from October. Moreover, Kalyan Singh, perturbed at the possibility of the growth of the BSP's influence through its caste rallies, finds his position as the leader of backward castes in the state threatened. His outburst that the BJP is not the 'bandhua mazdoor dal' (bonded labour party) of the BSP stems from his growing frustration.

The Periyar mela also exposed the opportunism of the BJP. On the second day of the mela Kanshiram reopened his diatribe against Gandhi. A year ago when Mayawati had launched a similar attack on Gandhi the BJP had vociferously demanded that the Congress should withdraw its support to the SP-BSP government. Now placed in a similar situation, the BJP finds Kanshiram's remarks not sufficient ground to withdraw its support to the Mayawati government. In Maharashtra, the BJP has formed a coalition government with Shiv Sena whose chief, Bal Thackeray, has repeatedly expressed his admiration for Nathuram Godse, the assassin of Gandhi. By focusing on Ambedkar, Periyar and Shahu in the Hindi heartland of UP, which lacks a native tradition of dalit heroes, the BSP has forced the BJP to come out in its true colours.

Net household saving in financial assets as per cent of GDP (at current market prices) which rose from 8.1 per cent in 1992-93 to 10.7 per cent in 1993-94 declined to 10 per cent in 1994-95. Bank deposits have declined by Rs 647 crore so far this year over March 31, 1995 against a rise of Rs 9,084 crore in the corresponding period last year. M3 growth has been sizeable despite this, due to currency expansion on account of the sharp rise in net RBI credit to the centre. Forex assets are continuing to fall despite a rise in FIIs' portfolio investment during June-August. With the FIIs' renewed interest, the Sensex has shown a 2.2 per cent increase in the past one month.

BSES

From Distribution to Generation

BSES, incorporated in 1929, is one of the largest private sector power company in country. Financial institutions hold a controlling stake with 51.75 per cent, 29.74 per cent is held by individuals, other corporate bodies 6.08 per cent, foreign institutional investors and nationalised banks 3.52 per cent and 0.22 per cent, respectively. The company recorded a turnover of Rs 1,160 crore for the year ended March 1995, an improvement of over 20 per cent over Rs 964 crore recorded in the previous year. A zero tax provision saw net profit spurt to Rs 147 crore from Rs 71 crore for the same period, though gross profit grew at a modest rate of 27 per cent, from Rs 134 crore to Rs 170 crore. A dividend of 26 per cent has been declared by the board of directors. BSES provides electricity to suburban Bombay from Mahim in the south to Bhayander in the north covering an area of 420 sq km. It supplies electricity to nearly 1.6 million consumers in the city of Bombay, of which 50 per cent are domestic, 20 per cent industrial and 3.5 per cent commercial consumers. At present the demand faced by BSES is 900 MW which is expected to increase to 1,200 MW by the year 1999-2000. The company is investing close to Rs 869 crore in an effort to modernise its distribution network, with an emphasis on system improvement. The company plans to create modern system coded and data augumentation (SCADA)-based load despatch centre to service this demand. The biggest share of the total investment has been earmarked for replacing the cables, some of which are nearly 40 years old. Of the total investment 33 per cent will be on 11 KVLT (low tension) lines, which connect the network to the final consumer. The company spent Rs 130 crore receiving stations, on the installation of electrostatic meters for high tension (industrial) and low tension (LT) consumers. All these moves are expected to reduce transmission losses. Transmission and distribution losses stood at 14 per cent in the year under review, down by 1 per cent, and the company hopes to bring these down to 12 per cent by 1996-97. At the present level of operations a saving of 1 per cent translates into a gain of nearly Rs 14 crore, and the company has been giving due attention to cutting down these losses. While technical loss depends on the high and low tension consumers and may be around 8 per cent the rest can be accounted for by pilferage. Apart from replacing electricity meters and laying down cables the company has divided the licensed area into four zones for power distribution, to monitor the transmission and distribution losses. This would make it easy for the company to zero in on the problem areas.

BSES, primarily a distribution company is looking for a diversified role whereby the company will take up generating projects along with distribution. A beginning has been made by bidding for several generating projects in Andhra Pradesh, Rajasthan and Tamil Nadu. The company has shown its willingness to take up these projects on the condition that it is allowed to take up distribution too. The distribution project could be in any part of the state and not necessarily connected to the generating project. BSES is changing from being an essentially distribution Company, sourcing its requirements from Tata Electric company to a generating-cum-distributing one, by setting up two 250 MW units at Dahanu and Pune. The first unit of Rs 1,419 crore project was synchronised in January 1995 and the second unit in March 1995. The company plans to double the capacity of its Dahanu plant by adding another 500 MW. BSES is to hold a 60 per cent equity stake in a new power project to be located at Srimushnam in South Arcot district in Tamil Nadu at an estimated cost of Rs 1,800 crore. The project of the Tamil Nadu Industrial Captive Power Company (TICAPCO) is being promoted by various local power consuming companies, Scandinavian Technical Services, Sharjah and others, for setting up a 250 MW power station in Tamil Nadu. Three more power projects of 500 MW are being planned. The three new projects may be located in Maharashtra, Madhya Pradesh and Andhra Pradesh. BSES has also been shortlisted for the 500 MW Suratgarh project in Rajasthan. The company is exploring the possibility of setting up a coal washery at the linked mine at Korba in Bilaspur in Madhya Pradesh which will enable the company to use washed coal with low ash content. The coal washery project will be jointly promoted by Spectrum Technologies and CLI Corporation of the US. The new company Spectrum BSES Coal Washeries will have an equity of Rs 20 crore of which Rs 6 crore will be put in by BSES. The estimated cost of the project is Rs 50 crore.

The company has plans to set up an infrastructural leasing company to fund its projects having large capital outlay and long gestation periods. The company will be a subsidiary of BSES, with an initial capital of Rs 30 lakh. BSES Telecom has been formed to take advantage of the emerging opportunities in the telecom sector. The subsidiary will provide value added services in the areas of software and computer services and communications. BSES is also planning to lay fibre optic cables along with its power cables in Bombay city for telecommunications company. It will allow the use of these transmission towers by service providers for a fee. The company's foray into telecommunications has been inspired by the liberalisation of the telecom sector, coupled with the fact that power and telecom are allied areas requiring similar infrastructure. BSES has targeted a turnover of Rs 1,000 crore from its telecom ventures in the next three years.

At present the customer profile of BSES is skewed more towards the residential customers who comprise nearly 85 per cent of BSES consumer base but generate a revenue of 50 per cent only. With the commissioning of the Dahanu plant the company hopes to rectify this as the plant hopes to attract industrial consumers, thus improving the profit margins for BSES. In the area of distribution, tie up with a foreign company is on the anvil. Talks are on with four companies — Niagara Mohawk, China Light and Power, Hong Kong Electric and London Electricity. BSES is now extending its sphere of operations to Andhra Pradesh. The Andhra Pradesh State Electricity Board (APSEB) is to sign a management contract with BSES for operating and managing the distribution system for Hyderabad, Secunderabad and nine adjoining municipalities for a period of one year. BSES has entered into a memorandum of understanding with NTPC to establish a joint venture company to undertake business in the area of construction, erection and other project management activities in India and abroad. It is proposed to form a company Utility Powertec, with an initial authorised capital of Rs 50 lakh. BSES will hold 51 per cent stake in the venture with NTPC holding the rest. Under the agreement reached by them, joint responsibilities will be shared according to each company's expertise. The combine has already made a beginning by bidding for the 1,050 mw Bakreshwar power project in West Bengal. The com-

pany has received in-principle approval of the government of India for the proposed Euro Issue for an amount up to US $ 125 million.

DABUR INDIA

Diversification through Collaborations

Dabur founded in 1884 by S K Burman, an allopathic doctor, was set up with the initial aim of selling allopathic formulations to treat plague, malaria and cholera. A switch over to ayurvedic medicines followed soon and today with diversions and diversifications the company, a 112 years old, has six different divisions handling health care products, family products, natural gums, exports, pharmaceuticals and veterinary products. The company manufactures about 450 products marketed through a network of 3,000-odd retailers. It is the largest manufacturer of branded ayurvedic products and also their largest exporter.

The company achieved a turnover of Rs 387 crore for the year ended March 1995, a rise of around 26 per cent from Rs 308 crore achieved in the previous year. A rise in dividend earnings from Rs 3 crore to Rs 9 crore, a rise of 200 per cent gave a boost to total income which moved up from Rs 322 crore to Rs 408 crore for the year under review. Interest costs came down by 12 per cent while there was a rise of 43 per cent in the provision for depreciation. Profit before tax stood at Rs 31 crore up by 49 per cent from Rs 26 crore achieved last year. A 7 per cent increase in the tax provision did little harm to the bottomline and the company closed the financial year with a net profit of Rs 24 crore, up by 68 per cent from Rs 14 per cent in the previous year. A dividend of 30 per cent has been recommended by the board of directors as against 25 per cent given last year. Exports registered a growth of 49 per cent moving up from Rs 22 crore to Rs 33 crore for the year under review. Imports rose by 110 per cent. On the export front, the company ended up with a net foreign exchange inflow to the tune of Rs 20 crore. Growth in demand for the company's products in the European market was satisfactory. The company has plans to extend its range of consumer products in west and south-east Asia. By adding these new products to its portfolio, the company hopes to achieve a 35 per cent growth in exports. The company established new markets in Morocco, Sudan and Malayasia and is planning an entry into China and Vietnam.

Dabur India has entered into a joint venture with the US-based pharmaceutical company,

Sepracor, to manufacture Paclitaxel, an anti-cancer drug in Canada, with InNova Pharma being set up for this purpose. Both Dabur and Sepracor's 100 per cent subsidiary, Seprachem will hold 50:50 stake in this company. InNova would have a paid up capital of $2.5 million. Dabur's contribution to the company's equity will be both in the form of goods as well as cash — $ 7,50,000 in goods and $ 5,00,000 in cash. Anand Burman, director, Dabur India, said Dabur would supply DAB-10, an intermediary required for the production of Paclitaxel, while the side chain as well as the technology required for bonding the side chain and DAB-10 to manufacture Paclitaxel would be provided by Sepracor. Paclitaxel is currently being used to treat ovarian and breast cancer. InNova is expected to commence commercial production in June 1996. Meanwhile the company's injectibles plant at Badi has successfully commenced the commercial production of a life saving anti-cancer drug, viz, Intaxel, spearheading the introduction of an oncology range of injectibles has been launched after completion of trials. During the year the company developed two more bulk drug technologies and began commercial production of Flucanozole and Citrizine dihydrochloride, the first being an anti-fungal, antibiotic drug and a second generation anti-histamine. Dabur is planning a strategic alliance with a Japanese company, Shikibo, for its natural gums division. Dabur's natural gum plant is located in Alwar, Rajasthan and has an annual capacity of 3,000 tonnes per annum. In confectionaries, the company has tied with Spanish giant Agrolemen to manufacture chewing gums,bubble gum, toffees, chocolate and cocoa-related products and sugar-based spreading creams. Rs 18-crore plant at Badi in the Solan district of Himachal Pradesh is to go on stream next year. Dabur has a 49 per stake in the venture called Carbur India. Agrolemen holds the balance 51 per cent and will handle the marketing. A strategic alliance with Unilever to manufacture and market ayurvedic- and herbal-based products is being planned. Dabur is weighing the advantages of manufacturing herbal-based products like soap and toothpaste which would then be marketed by Hindustan Lever. Dabur is planning to diversify its product range and is negotiating with the US-based perfume giant Avon to set up a joint venture in the country. The investment in the project is estimated to be between Rs 30 crore and Rs 50 crore. The company is also planning to diversify into cosmetics and dairy products through alliances with multinationals. The company, planning to enter the high quality biscuit manufacture, is holding talks with a number of foreign companies for a possible collaboration. The investment in the project would be around Rs 30-40 crore. The company plans to enter the milk products business and in this segment its talks with a French company to make cheese are already in an advanced stage of negotiations.

Through its research and development activities the Dabur Research Foundation has come out with new products like Lactonic, Dentacare and Vatika.

SIV INDUSTRIES

Good Performance

SIV Industries formerly known as South India Viscose, a Coimbatore based company is a major manufacturer of viscose staple fibre and wood pulp. The company closed the financial year with a sales turnover of Rs 351 crore, up from Rs 281 crore recorded in the previous year, a rise of 25 per cent. Total income rose by 11 per cent from Rs 310 crore to Rs 345 crore for the year under review. Net profit stood at Rs 40 crore, up from Rs 22 crore achieved in the previous year and could have been higher were it not for a tax provision of Rs 7 crore as against Rs 3 crore in the previous year. Interests costs rose by 1 per cent and provision for depreciation went up from Rs 8 crore to Rs 10 crore, a rise of around 30 per cent. A dividend of 35 per cent has been recommended. The company diversified into the manufacture of edible oils a couple of years ago. The edible oils division which contributed around 9.4 per cent to the turnover proved to be a drag on the bottomline. The company blamed the erratic monsoon that affected the availability of sunflower seeds for the poor capacity utilisation at the company's plant at Palani. The company has obtained the shareholders' approval for selling/leasing the edible oil unit at an extraordinary general meeting in April 1995. Working of the viscose staple fibre plant at Sirumugai during the year was satisfactory With a capacity of 39,000 tonnes per annum, it constitutes only around 15 per cent of the total capacity available in the country. VSF is a cellulostic fibre which is a close substitute to cotton used in blended yarns to provide the fabric a smooth feel and improve moisture absorption capacity. Production of VSF went up from 24,599 tonnes in 1993-94 to 29,764 tonnes in 1994-95. Higher realisations available to the VSF manufacturers were responsible to a large extent for the improved performance of the company. VSF prices, which were around Rs 60 per kg during mid-1994, climbed to Rs 72 per kg and stayed at those levels. Prices of the VSF went up because the prices of cotton had climbed up by more than 75 per cent during the year following shortages caused by hoarding. VSF being a close substitute for cotton, demand for cotton shot up.

The company sources its requirements of pulpwood from both government plantations as well as private sources. With a view to providing for its requirement of raw material, the company has an agro forestry programme which has covered more than 20,000 acres with nearly 14 million seedlings/trees planted. The company's operations are fairly intergated, possessing as it does a 60,000 tonne rayon grade wood pulp manufacturing capacity. The pulp plant at Sirumugai is in danger of being closed down as per the orders passed by the Tamil Nadu government on the ground that the company is not taking effective pollution control measures, that the treated effluents do not meet the standards prescribed by them. Nonetheless the company has decided to go ahead with its modernisation programme at an estimated cost of Rs 796.50 crore, of which Rs 200 crore has been earmarked for revamping the effluent treatment plant. The company has an ambitious modernisation programme. As per the plan the SIV pulp plant which had a capacity of 180 tonnes a day would be upgraded to 300 tonnes a day over a period of three years. For the pulp division the company is to collaborate with Wagner Beurag and Lenzing. The company has tied up with Lindox of Germany for the import of the "oxygen aerated sledge reactor" at a cost of Rs 70 crore to take care of the pollution aspect. Again on the point of pollution, the company is to switch from the present calcium-based method to the magnesium process at an estimated cost of Rs 60 crore. The viscose staple fibre (VSF) plant, is to be upgraded to 250 tonnes a day. The company is to spend Rs 370.70 crore on the expansion of the VSF and the viscose staple yarn. The company proposes to finance its expansions from the 60 million dollars realised from its Euro issue which the company came out with in last August. The company installed the third wind energy farm of 2MW capacity comprising eight wind mills in May 1995 at Perungudi in Tamil Nadu at a cost of Rs 7.19 crore, taking the total energy capacity to 5 MW at an investment of Rs 20 crore. The company plans to set up another wind mill in Tamil Nadu during the year.

RANDOM REFLECTIONS

The Saga of the Babus of Nayanjore

Arun Ghosh

The economic management of the economy over the past four years has been so inept that any successor government would find it extremely difficult to change the basics of the situation, namely reliance on the World Bank, the IMF and international finance capital to provide succour to the Indian economy.

THE finance minister of India is reported, recently, to have made the statement that: (a) the economy is basically in good shape, and growing at more than 5 per cent per annum; (b) the only problem today is the continuance of the fiscal deficit which needs to be curbed; and (c) the only way the fiscal deficit can be curbed is by privatisation of public enterprises.

In today's political rough and tumble, what the present finance minister says is not very important. The present government stands discredited in the eyes of the people; the party is deeply divided, and the possibility of a new coalition (after the next general elections) looms large on the horizon. One would not have wasted one's time and energy commenting on what a lame duck finance minister says. And yet, what he stated needs to be analysed because his speech represents a 'mind-set'; and that 'mind-set' could well prevail even after the general elections. The 'mind-set' represents the viewpoint of the elite in this country who have everything to gain while the country gets ravished by an unholy combination of domestic and international finance capital. It is for this reason – the possibility of a continuance of the present set of policies after a new government is formed at the centre, in 1996, being quite high in fact – that it becomes necessary to sound a timely warning, and to dissect the statement of the finance minister for what it is worth.

Clearly, the economy *has* been growing. It would be remarkable if it did not, after an eighth consecutive good monsoon. Yet, it *is* also remarkable that the economy still continues to grow after a total neglect of infrastructure (by the government) over the past four years. The explanation, of course, is that infrastructure investments have a long gestation period; the effect of the neglect of infrastructure would get reflected on the performance of the economy after a few years. We are then likely to face a perennial power shortage, transport bottlenecks, and the dreadful conditions of all civic services in all urban areas. (Clearly, the lessons of the plague in Surat have been quickly forgotten).

But, while the economy has indeed been growing, the 1992 NSS results show a deepening of poverty in the country. The results of the more detailed 1993-94 NSS survey of consumption expenditures are unlikely to be released before the next elections; but one can hide the reality only from a few urbane groups; the majority of the population has firsthand experience of the deterioration in consumption and living standards. Any discerning observer can also notice the sudden increase in the incidence of TB – which was supposed to have been eradicated but has resurfaced as a result of a combination of malnutrition and unhealthy living conditions – of malaria, of other epidemics (like hepatitis, influenza and pneumonia) which sap the vitality of the poorer sections of the population.

The finance minister ought to be told that if, meanwhile, the economy is still growing, it is *because* of the fiscal deficit. Given all the other policies, take away the fiscal deficit, and even aggregate growth of output would disappear, as if by magic. Regrettably, it is the 'problem' that the finance minister has identified which is still providing an overall growth impulse to the Indian economy today.

Perhaps the finance minister is aware of this. But politically, he cannot take that position, for the hollowness of the overall policy framework would then become apparent. The extant economic reform policies have had the effect of reducing the aggregate rate of domestic saving from nearly 24 per cent of the GDP in 1990-91 to around 20 per cent in 1993-94, the reform policies have yet to get our merchandise exports to exceed imports, and adding interest on external debt – which is now around $ 96 billion – we have a large deficit on the current account of external payments; and to the extent our external reserves have gone up (to some $ 19 billion as of mid-August); it is matched by the inflow of short-term external capital which can be kept in the country only by maintaining an extortionate interest rate, far higher than such capital can earn abroad. Incidentally, the high interest rates also aggravate the fiscal deficit problem; the 1995-96 budget indicated 52 per cent of the centre's revenue receipts being required to meet only debt servicing charges; and the latest borrowing by the government (from the market) has been at 14 per cent interest. In Japan, the discount rate is a fraction above 1 per cent. All in all, the economic management of the economy over the past four years has been so inept that any successor government (in 1996) would find it extremely hard to change the basics of the situation, namely, reliance on the World Bank, the IMF and international finance capital (now ensconced as foreign institutional investors or FIIs, in India) to keep providing succour to the Indian economy. This succour would, of course, be at a price; the price of private external (investment) capital today is a return of anything between 30 per cent to 100 per cent annually, on the capital imported. Like the typical Indian farmer before independence, indebted for life to the indigenous moneylender, the Indian economy is now getting into a permanent debt-trap insofar as international finance capital is concerned.

It is more than likely, therefore, that a successor government in 1996 would require another 'avatar' of Manmohan Singh – acceptable to the World Bank – as the next finance minister of India. And regrettably, judging from some recent actions and attitudes of the leaders of the National Front, the BJP, indeed even of the Leftist parties, we could well find even the present finance minister in charge of the finances of the country after the next general elections. It is the 'mind-set' of the elite in this country which poses the greatest threat to the country.

Let us now come to the third part of the finance minister's analysis of the present economic scenario. The only way the fiscal deficit can be reduced is by privatisation of public enterprises. In other words, (a) the tax effort is a hogwash, (b) the easy way out is the sale of the marketable assets owned by government, and (c) this can be depicted as a heroic effort to increase efficiency through privatisation.

Three points are to be noted. In July 1991, when the finance minister first mooted the idea of partial sale of the equity of public enterprises, he is on record to have stated that he was reluctant to sell part of the equity of public enterprise, but he had no option as he had to rapidly bring down the fiscal deficit. Of late, the finance minister has become a votary of *privatisation* in the name of efficiency.

Secondly, and this is an interesting point, there is no attempt to privatise any loss making public enterprise. There are just no takers. So, privatisation is to be limited to only highly profitable (and efficiently performing) public enterprises, those in the 'oil' sector, in the 'telecom' sector et al. The sad fact is that the profitability of these enterprises is quite substantial. Most of them do not require any budgetary support for their expansion; they can attract loan finance provided they can use their retained profits as additional equity. Most of them also serve a larger national purpose – e g, the ONGC by way of 'exploration' of oil which would be given the go-by by a private entrepreneur; the C-Dot by way of developing rural exchanges from the profits made from metropolitan areas – and the larger national purposes are obviously of no interest to the private sector. All these enterprises are also in a monopolistic/ oligopolistic situation, so that privatisation would be tantamount to converting public monopolies into private monopolies.

All that is well known. And yet, the pressure has to be maintained, the people have to be brainwashed, in order to enable the finance minister to seek the easy option of raising resources by selling off the most valuable, the most prized assets owned by government.

Someone had likened this exercise to the sale of family silver. Indeed, it is more than that; the family silver does not bring a direct return. It is an asset, an heirloom. But the public enterprises proposed to be privatised are contributing to the exchequer; they are profitable. Their sale, therefore, is tantamount to selling-off income-yielding assets. *We are selling these assets for present consumption expenditure*, for reducing the fiscal deficit. It is not as if the finance minister wants to raise resources for new investment on infrastructure. No. The emphasis is on reducing the fiscal deficit, which can be achieved by: (a) cutting down on public investment, which is what has been happening, and (b) selling off the equity of public enterprises.

No wonder, the new combination of domestic and international finance capital welcomes this step. The mechanism provides an easy way to acquire the ownership of highly profitable, monopolistic enterprises. And, the combination of domestic and international capital is a powerful combine; and it has succeeded in befuddling even some eminent Leftist leaders into thinking that the inflow of external capital would resolve the problem of raising domestic resources. The new combine of domestic and international finance capital also welcomes the high rates of interest in India; rentier incomes can grow thereby, at the cost of real wages of the working classes. Of course, the former (that is, domestic finance capital) does not realise that a tottering infrastructure can (and will soon) redound on it. But then, capital flows (and capital flight) are a reality in the modern world; and the recent example of Mexico is there for all to see. Domestic finance capital can also move out; there are umpteen tax havens today, and in any case, east Asia offers opportunities of high return.

More than half a century back, the late Rabindranath Tagore wrote a short story, titled 'The Babus of Nayanjore'. The story is of a landlord who believes in living it up. He has been doing so by selling-off his inherited property, gradually, bit by bit. The last scene is one of a great music-cum-dance fest organised by him at his residence; the fest has been paid for in advance, and the money for the fest has been raised by selling-off the house where he lives, where the fest is being held. This is the last night he is allowed to occupy his own house. Come morning, he is out in the street without a penny. The music and the dances are on, and our Babu of Nayanjore, erstwhile zamindar, is drinking away, unmindful of the morrow.

We Indians today are like the Babus of Nayanjore; what happens to the coming generations is not our concern. We can live it up by borrowing to the hilt. The problem is, only a small segment of the population is really living it up; the rest of the countryfolk have no say in the matter, and indeed, they are already facing some part of the privations that the nation as a whole will be made to bear in the years to come.

Is there no way we can avoid this fate? Of course, there is. But that requires policies that would enthuse all the people of the country to work and to save, and that in turn requires all the people in the country being assured of enjoying the fruits of their labour. Between 1952 and 1990, Chinese 'labour participation' increased from 36.1 per cent (in 1952) to 49.6 per cent (in 1990). *And*, they raised the rate of domestic saving to some 40 per cent of the social product. The 'micro efficiency' of the firm did not bother the Chinese; and even today, Chinese industry by and large is a horrendous user of energy. And yet, the Chinese economy has been growing by between 12 and 15 per cent annually. Despite the years of the Great Leap Forward and the Cultural Revolution, Chinese agricultural output has been growing at some 4 to 5 per cent per annum (on an average) if the entire period from 1949 is taken. Rural industries in China have been growing at 18 per cent annually.

We do not need to initiate *any* economy, neither the Chinese no the South Korean nor the Taiwanese the last two both lauded by the World Bank and our neoclassical neoliberal friends in the economic community. But we can draw lessons from both our experience and experience around the world; and that lesson (from Japan, South Korea, Taiwan) is to start with land reform (forced on these countries by Douglas MacArthur in 1945). From China, we can draw the lesson of *decentralisation* of economic decision-making to the local community level. It is interesting to note that after the Deng Xiaoping reforms of 1978 – and the return to the 'family responsibility' system in regard to farming – one village, Nanje, went back to the system of communes in 1986; and that village is prospering at a rate well beyond the Chinese average growth rate (*vide*, Lincoln Kaye, in the *Far Eastern Economic Review*, November 17, 1994). *That*, namely, local responsibility for agrarian growth, has been basic to Chinese strategy, together with heavy state investment for the build up of infrastructure and heavy industries. The Chinese population could save because Chinese food supply (and the output of necessities) rose sharply following the Chinese reform policies. We, in India, are sitting on 37 million tonnes of foodstocks, and endeavouring to export part of it, even as a large segment of the population goes to bed hungry. A 'pro-reform' economist like Kirit Parikh had to perforce comment on this situation wryly.

The solution to India's economic problems lies with the people of India, their endeavours, their savings effort, their enterprise. Sadly, we have been lulled into complacency by the large influx of external capital post-July 1991. But the returns sought by external capital are exemplified by the famous Dabhol Power Company episode; the IDBI appraisal note found the return on equity to commence with the guaranteed 16 per cent in year 1 to 54 per cent by year 7. And this calculation does not take into account the 'padding' in capital costs, which more than pays for the equity.

The *International Business Week* (of New York) recently reported that the average return on equity for the 1,000 top US companies during 1994 was 30 per cent. Obviously, external capital would look for a higher return when desirous of investing in a plague-infested country like India. But the Babus of Nayanjore do not understand the logic of usury, the motivation of finance capital. They are content to live it up.

If this is what the present leaders of the Congress Party, the BJP, the National Front, the Left Front *all* want, who is to prevent a mirror image of Manmohan Singh from being the finance minister of India in 1996?

COMMENTARY

NEW DELHI

Compendium of Failures

BM

With the Narasimha Rao government's tenure drawing to a close, the earlier dithering in decision-making and the inefficiency in administration is giving way to something worse – a flippancy about matters of public concern. Here is a bunch of 'leaders' which has no sense of accountability nor any commitment to democratic principles.

THE cycle of alienation and violence is tending to engulf Indian society and polity. The assassination of the Punjab chief minister, Beant Singh, is yet another manifestation of this dangerous trend. The reaction of the elite and the general public has been one of indifference. More disconcerting still, politicians of all hues and affiliations have tended to rely more on the police and paramilitary forces and the army for security. Julio Ribeiro, the retired police officer with a reputation of integrity and grit was probably the only one who could contain the militancy in Punjab to some extent. He compared the Punjab terrorists with the IRA and Armenian militancy and emphasised the need for a prolonged "battle for hearts and minds of people", which has never been truly joined, let alone won in Punjab. The imperative of a political approach to issues which agitate the majority of the people has, in fact, been singularly missed by the ruling elite.

While government leaders have been anxious to whitewash their failures in Punjab and elsewhere, Harkishan Surjeet, the general secretary of the Communist Party (Marxist) has gone to the extent of saying that "a series of court judgments had weakened the resolve of the state police" and "played a role in the tragic incident" in Punjab. This amounts to an advocacy of the policy of giving the law and order machinery a 'free hand' for tackling the terrorist menace, so much so that even judicial restraint must be abjured. The implications of this stand are grave for the citizens who are victims of both the terrorists and the state forces. It is subversive of the democratic order based on the rule of law.

The moral and political dimensions of the decay of Indian polity should not be dismissed in a cavalier fashion. Serious thought must be given to the growing alienation of the masses from the organs of the state, inefficient and repressive as they are and from the unprincipled and corrupt politicians. The performance of the ruling elite in India is becoming murky on all counts. The government's view of the crisis situations is coloured with narrow factional considerations. Social cohesion has been ruptured and civic order is in disarray.

Contrary to the claims that the return of the Congress Party to power has helped to restore political stability, regional pulls and pressures as well as communal, caste and ethnic conflicts have sharpened during the last four years. This is concomitant with a state of affairs in which the socio-economic and political policies have been geared to serve narrow vested interests rather than community interests as a whole. A dangerous new feature has been the wider scope available to foreign interests to pressurise and interfere in the shaping of official socio-economic and politico-strategic policies. With the Rao government's tenure drawing to a close the dithering in decision-making and inefficiency in administration is giving way to a certain flippancy about matters of public concern. The expansion of the council of ministers by the prime minister is a case in point. It has been inspired unquestionably by factional considerations. It is an admission of the exhaustion of Narasimha Rao's resources and abilities to hold the office of prime minister of India and the president of the Congress Party. Rao and all government leaders, including the finance minister, no longer hide the fact that the economic reforms have run into snags which they are in no position to overcome. They now make a virtue of the fact that the reform process has come to a grinding halt because of explicit electoral constraints. If today political constraint is the alibi then the earlier talk of the irreversibility of the reforms was obviously a sham. The union finance minister Manmohan Singh, widely applauded at one time as the economic wizard, is more articulate than anybody about the tawdry implementation of the reform programme. But having turned into a full-fledged politician, he cannot think of tendering his resignation – an act which might restore the reputation he enjoyed before he joined the Rao government. He has found it more convenient to get sucked into the Congress culture of clinging to office and the cult of sycophancy. His equanimity is not disturbed any more by the fact that the promises of the government's reform programme have not materialised and his commitments are now honoured in their breach.

It was quite a spectacle to watch the performance of ministers at the Economic Editors meeting organised by the Press Information Bureau this year. The union finance minister claimed that the rate of inflation would not go beyond 7 per cent, when it had again begun to climb. He, along with the commerce ministry, dismissed as of no consquence the widening of the trade gap and the increase in the current account deficit even when the Indian rupee has come under pressure and its exchange value is eroding. The agriculture minister was determined not to cut subsidies for rich farmers. He was unworried by the declining trend of offtake from the public distribution system, in spite of the burgeoning food stocks, because the poor did not have the purchasing power. The energy minister bemoaned the dark days ahead as the Enron contract had been cancelled but was not willing to own responsibility for the Enron fiasco and for keeping Indian capacities for the power sector development idle. Here is a bunch which has no sense of accountability nor any commitment to democratic principles. While Salve contemptously dismissed the Indian alternative for power development and tried to side-track issues raised by the Enron deal by setting 'revised' norms for foreign power companies, Manmohan Singh mounted a tirade against Swadeshi.

Swadeshi has indeed become a dirty word for the self-styled reformers of the Indian economy. Self-reliance is denounced by them as autarky. Those who object to the loot of Indian wealth and markets by foreign business interests are derided as suffering from xenophobia.

Where is the question of India becoming autarkic because Enron has been found to be a questionable deal? India, during the days of planned social and economic development never shut its door to capital or technology inflows from abroad. But it tried to seek foreign financial and technological collaborations, both in public and private sectors, with at least some measure of concern for development interests and planned priorities. But it is equally beyond doubt that the approach and behaviour of the developed countries, the international financial institutions and multinational corporations towards India has always been questionable. Currently, however, the only concern of the so-called reformers is that the flow of foreign capital may dry up because of the growing resistance within the country to the unchecked exploitation of India's markets, resources and labour. Rao in his address on independence day, and on other occasions, has repeatedly and labouriously elaborated the policy of total reliance on foreign capital for industrial infrastructural development for which purpose he claims

to have geared India's aid diplomacy. This marks a total break with the policy of seeking low cost credits for economic plans which clearly stipulated that foreign assistance would be availed of to supplement what had to be, essentially, indigenous efforts to promote socio-economic development through mobilisation of domestic human and other resources. This is how self-reliance was defined in the planning era. In the 1990s however, since the formation of the Rao government, efforts to mobilise domestic resources and skills have been abandoned.

The implications of the government's policy on foreign aid are far-reaching. The policy is based on the premise that India has no option but to directly rely on foreign private capital for the growth of the Indian economy and would, while continuing to rely on foreign official credits to service the outstanding foreign debt – nearly 100 billion dollars – as well as minimum essential social sector expenditure. Foreign capital has been given full freedom to undertake investment in accordance with its global business priorities and the criterion of profit-maximisation. In the social sector, education and primary health services have suffered gross neglect while higher education and modern health services are being run on commercial principles. Manmohan Singh claims that foreign direct investment or portfolio investment from abroad will also take care of the balance of payments problem. The fact, however, is that Manmohan Singh is still carrying the begging bowl for official aid. Overzealous supporters of the so-called economic reforms are asserting that foreign direct investment is necessary in order to move away from the critical dependence on official foreign aid. This is euphemistically called switching to "non-debt creating inflow of foreign capital". They have now come out openly and unabashedly to defend even the Enron deal which the company is desperately trying to salvage by 're-negotiations'. The extortionate returns on foreign investment guaranteed by the central government are also applauded and those who object to this position are denounced as being xenophobic. This is surely not the way to a viable balance of payments position. It is the poor people of India who face the risk of these arrangements. Foreign investors are to enjoy risk-free operations. Even the World Bank officials have now started to caution that large-scale foreign investment into India could pose "problem of servicing, particularly in terms of repatriation of earnings". The acute balance of payments position and the "problem of servicing the large foreign debt were the ostensible reasons why the IMF-World Bank combine pressed India to prefer private foreign capital even on highly inequitous terms. But this has only aggravated India's economic vulnerability in respect of its balance of payments position. The essential commitments in this dispensation have already broken down. The rupee has come under pressure and is suffering further devaluation. The revenue and fiscal deficits of the government are larger than the ones in 1991. Foreign debt has increased. The Indian government is now obliged to carry a much bigger bowl, not only for credits on concessional terms but also for investment funds by accepting the inflated claims of commercial returns by foreign financiers and investors.

INTERNATIONAL JOURNAL OF DEVELOPMENT PLANNING LITERATURE

CALL FOR PAPERS

Unpublished research papers on any topic related to development studies are invited for publication in the **International Journal of Development Planning Literature**, ISS No. 0970-3608, started in 1986. This Journal has an Editorial Board of internationally distinguished economists and is published quarterly by the SPELL BOUND PUBLICATIONS PVT. LTD., ROHTAK

Authors may contact:

Professor S. Bhagwan Dahiya
Chief Editor,
INTERNATIONAL JOURNAL OF DEVELOPMENT PLANNING LITERATURE
Post Box 91, Rohtak-124 001 [INDIA]

JUST PUBLISHED

CHILD DEVELOPMENT

Issues, Policies and Programmes

3 Vols Set

Dolly Singh

Three volumes set provide a broad-spectrum view of the nature and substance of children's development activities since the year of the child. As such, it will provide and open a wide window onto the larger landscape of children and child development policies and initiatives.

VOL. 1 : SOCIAL CONTEXT OF CHILD DEVELOPMENT

VOL. 2 : POLICIES & DYNAMICS OF CHILD DEVELOPMENT

VOL. 3 : EXPERIENCES & EXPERIMENTS IN CHILD DEVELOPMENT PROGRAMMES

Communalisation of Tribals in South Gujarat

Stany Pinto

Hindutva demagoguery has effectively converted hitherto non-communal tribals of Gujarat into Muslim-baiters.

COMMUNALISM and communal violence was basically an urban phenomenon. But in the wake of Ayodhya incident its spread has not spared the villages, and even more significantly, the tribal areas of Gujarat

The tribals in Gujarat constitute 14 per cent of the total state population, concentrated mostly in the highlands covering the eastern border of the state. There are 31 officially recognised scheduled tribes in Gujarat. Numerically Bhils, Dublas, Dhodias, Chodhras, Naikas and Gamits are major tribes of Gujarat.

According to a study conducted by Sardar Patel Institute of Economic and Social Research in 1980, the incidence of poverty is highest in the highland region of Gujarat. For every 100 poor persons in Gujarat 31 belong to the tribal areas. The traditional tribal socio-religious and cultural institutions have been under attack by the non-tribals, commercialism and industrialisation. The tribals of Gujarat continue to be under poverty, illiteracy, disease, vicious exploitation, indebtedness, pauperisation, petty crimes and land alienation. However, communalism and communal violence in tribal areas of Gujarat was almost unknown till 1989.

This article deals with the communalisation of tribals and their participation in the communal violence in the three talukas of Bharuch district, viz, Valia, Dediapada and Sagbara. The article questions the widespread assumption that the problem of communalism, and particularly where Muslim minority is involved, is essentially a problem between Muslims and Hindus.

Socio-Economic Pattern

According to the 1981 Census there are nearly six lakh tribals in Bharuch district They are highly concentrated in the five-eastern talukas, viz, Nandod, Jhagadia, Valia, Dediapada and Sagbara. Vasava Bhils form the largest segment of tribals in Valia, Dediapada and Sagbara. The Tadvis or Dhankas, Choudharies and Gamits are found in small numbers, mainly, in Valia and Dediapada. Tadvis are mainly oustees of Karjan and Sardar Sarovar dams, settled in border villages of Dediapada. The Choudharies and Gamits are found in few villages of south-west Valia. The tribal population in Valia, Dediapada and Sagbara is 76, 93 and 90 per cent respectively. The non-tribals in these three talukas are upper caste Hindus, viz, Rajputs, Patels, Brahmins, Vaniyas, Marwaris and Pawars. There are also a small number of Parsis, Muslims and Christians.

The oustees of Karjan dam are found in the border villages of Dediapada and Sagbara such as Kevdi, Chikda, Ambavadi, Korvi, Moshit, Jargam, Samarpada and Sorapada. The Sardar Sarovar oustees have settled in Ambavadi, Tapavi and Patadi villages of Dediapada and few villages of Sagbara. The oustees and the non-tribals form separate hamlets in the villages. In most villages three is a house or two of caste Hindus and Muslims. They are highly concentrated in taluka headquarters and in small trade centres like Netrang in Valia and Selamba in Sagbara.

In all the three talukas, the tribals are economically backward. The reckless destruction of forests, lack of irrigation facilities, fragmentation of land, landlessness, indebtedness, exploitation by moneylenders over the years have pushed them further into backwardness. Majority of the tribals are either landless or have less than five acres of land. In Bharuch district 70 per cent tribals are landless and poor peasants, owning less than five acres of land [Shah 1976]. Most of them live on farm or migrant labour. After the monsoon crop they migrate to towns such as Ankleshwar, Bharuch, Surat, Navsari and Bilimora to work as construction labourers or agricultural labourers. As there are milk co-operatives in all the three talukas some tribals are engaged in dairy farming. For the tribals of interior Dediapada and Sagbara, forests still play an important role in their economic life. The benefit of educational institutions and government jobs has gone to few well-to-do tribals. Diamond-cutting centres and the increasing stone quarries are a new source of income for many a youth in the area.

In all the three talukas business, non-agricultural trades and industrial as well as governmental jobs are dominated by the non-tribals. Industries are found only in Valia and nearly 70 per cent of agricultural land here is owned by non-tribals. The forest department owns 50 and 29 per cent of land in Dediapada and Sagbara respectively. Compared to Valia the non-tribals and Muslims own less land in Dediapada and Sagbara, and that too in a few villages. The Muslims in Dediapada, Valia and Sagbara are mostly shopkeepers and moneylenders. They are also big landlords in some villages of Valia. Among the caste Hindus, by and large, Rajputs and Patels are landlords and Vaniyas and Marwaris are shopkeepers and moneylenders. Though most of the Parsis have sold their land few still cultivate land in villages of Valia and Dediapada.

Changing Religious Landscape

The Hindu religious organisations, viz, Bharat Seva Sangh (BSS), Vishwa Hindu Parishad (VHP), Rashtriya Swayamsevak Sangh (RSS), are active in all talukas and they monitor their activities from taluka headquarters. The main centre of BSS at Dediapada is run by a small group of 'sadhus' mainly to counter the missionary activities in the area. Occasionally, they organise 'shudhi yagnas' (purifying ceremony) for those who have 'polluted' themselves by embracing religion other than Hinduism. They run a small hostel for high school boys and a mobile dispensary. The Christian missionaries, protestants as well as catholics are settled in taluka headquarters and run schools, milk co-operatives, dispensaries and free legal aid centres in the talukas. Aghakhan Mandali, a NGO, is active in these three talukas, INREKHA, another NGO, is active in Dediapada while Bharuch Zilla Adivasi Seva Sangh runs 'Ashram Shalas' (residential schools) in all these talukas. Other NGOs like Seva Rural, Halpati Seva Sangh, Arch Vahini, Adivasi Seva Mandal, Sagbara Kelavani Mandal, etc, also function in the area.

Over the last few decades a noticeable change has taken place in the traditional religious practices and belief systems of Vasava Bhils due to education, Hindu sectarian movements, Christianity and Islam.

Among the Hindu sects, Bhatiji, Satkeval, Nirant, Sanatan, Ramanand, Jayagurudev, Kabir, Swadhyay Parivar, Swami Narayan and Sita Ram are prominent in all the three talukas. Most of these sects have their followers from well-to-do and educated tribals. Swadhyay Parivar and Swami Narayan sects, though largely followed by caste Hindus in tribal areas, also have a following among educated tribals. Most of these sects are of Hindu reformist variety [Lobo 1992].

Over the last ten years there has been a steady increase in Hindu shrines and temples of the above-mentioned sects in these talukas. According to one follower and propagator of Bhatiji sect, 350 shrines have been built during the last five years for Bhatiji alone. Practically, every village has a newly built shrine either at the entrance or in the centre of the village. A shrine at Devmogra is religiously most significant place for all the tribals in the area including the tribals of

Maharashtra and Madhya Pradesh. The tribals worship Yah (Mother) also known as Mohgi or Pandhar. According to the traditional belief, Yah likes a raw mud house and accepts grain and blood sacrifices of goats and chicken from her devotees. Today there stands a huge temple costing over Rs 60 lakh and housing not only *Yah* but also representative deities of almost all the above-mentioned sects. The traditional custom of offering blood sacrifice is banned, forcing traditional devotees find a new place somewhere in the vicinity of the temple.

Those who join above-mentioned sects acquire the social status of 'Sudhrela' or 'Bhagat' (civilised or holy man). The others remain 'Pachhat' (uncivilised) or 'Khanara Peenara' (meat eaters and alcohol consumers). For some of these sects, 'Paradeshi' (foreign) religions are not to be tolerated. Nagji Maharaj, a local guru of Sita Ram sect, goes around in the villages giving religious discourses in Hindi. He makes it a point to preach openly against the Muslims (whom he calls 'Mlechch'), the Christians and the Gandhians. Gandhians should be hated and eliminated because they are tolerant of the Muslims and the Christians. He lives on the river bank near Thava, a border village in Valia. He has his followers among the youth of border village of Dediapada and Valia.

The Christian protestants are found in all the three talukas while the catholics are mainly found in Dediapada and Sagbara. Some villages have prayer halls where community prayer services are held on Sundays. The protestant tribal Christians are discouraged from following their traditional religious and ritual practices.

The Muslim tribals are found only in Sagbara. Sagbara, Vadi in Mangrol taluka and Gantha in Maharashtra were three independent Vasava Bhil states under British India. Influenced by a Muslim saint, the chieftain of Gantha and then the Sagbara chieftain embraced Islam at the beginning of this century. The descendants of the Sagbara chieftain are concentrated in Sagbara town. The chieftain of Sagbara was the traditional head of Devmogra shrine. Keeping with the tradition, his Muslim descendants continue to inaugurate the worship even today during the two-day festival held in February each year. Close to Devmogra shrine there is also a Muslim 'Darga', reportedly of a Muslim saint who died there. The Darga was built by the Sagbara chieftain. Though there are no followers of Islam in Vadi, there is a Darga in the village which is looked after by the tribals of Vadi.

Events Preceding Riots

All the three talukas have no history of communal riots. It was the strong association between the events of 'Ramshilapujan', 'Rathyatra' of Advani and its 'Ramjyoth' and 'kar seva' spaced over a year and a half, which climaxed into the riots.

During Ramshilapujan in 1989, a collection of Rs 1.25 per household was made from the taluka headquarters and big villages along the state highway from Valia, Netrang, Dediapada, Sagbara and Selamba. The tribals were asked, "Are you Hindus? If you are, then prove it by contributing Rs 1.25 for Ramshilapujan. If you do not contribute you prove that you are from a Muslim womb!" Provocative speeches against the Muslims were made *en route*. On the appointed day the bricks were brought in a procession from villages to the taluka headequarters where more speeches were made on Babri masjid and Ram Janmabhoomi. Of all the three taluka headquarters, Dediapada witnessed the largest gathering. Navratri festival was used as an occasion to mobilise the tribals and to collect bricks and money. For the first time in the villages of Dediapada and Sagbara, Navratri garbas were organised under the guidance and sponsorship of BSS, RSS and VHP.

After Advani's rathyatra passed from Somnath towards Surat via Bharuch a combined mini rathyatra (on a jeep) was undertaken by BJP, VHP, RSS and BSS from Bharuch to Setamba via Ankleshwar, Valia, Netrang, Dediapada, Sagbara. It halted at big villages along the route and the villagers were encouraged to light the fire from Ramjyoth carried by the mini-rath. Fiery speeches were made inciting the tribals to drive out the Muslims and the Christians. The organisers of the rathyatra were largely non-tribals. The Muslim Darga at Devmogra was vandalised at the end of the rathyatra.

Following Advani's arrest and the *kar seva* incident, a Bharat Bandh call was given on October 24, 1990 by the BJP. Things began moving rapidly. A midnight gathering of tribal youth was organised in the forest near Gangapur village on the state highway between Dediapada and Sagbara, to explain the strategies of rioting and looting. Next day trees and boulders were rolled onto the road blocking the highway. Groups of people stopped vehicles, demanded money, broke windscreens and caused harassment. Groups of 15-20 people, generally drunk, began moving after dark, and pelted stones on Muslim houses in Dediapada. A large crowd of 5,000 had gathered at Moskut village in Dediapada for the 'Songariya' show, a folk performance. But the performers were halted on their way and their vehicle was not allowed to proceed. The crowd gathered in Moskut village became restive and later dispersed. They were met by rioters who instigated them to go berserk. Both these elements marched to the nearby Bedvan village and burnt some Muslim houses. It was the beginning of looting and arson.

There arose a conflict between the local BJP activist and the Muslims regarding the road leading to the mosque in Sagbara proper. The former's shop was located on the road. It is not known as to who threw the first stone as there were claims and counter-claims. However, seven Muslim houses were burnt on November 4, 1990. Usman, a PWD worker, was beaten and his belongings destroyed. Later, villages were singled out for looting. The Muslims in these villages were told in advance to quit the village. In the initial stages, the Muslims sent their women and children to Pat and Akkalkuva villages which has large concentration of Muslims. However, as the situation became grim, menfolk too heeded the warning and headed for safety much before the rioters could descend and destroy their property. Couple of Muslim houses were destroyed in each of the 22 villages of Sagbara, 35 villages of Dediapada and five villages of Valia. Bedvan, a village in Dediapada, was attacked first and suffered most. All the 15 Muslim families were affected as their houses were looted and burnt. Muslim shrines were vandalised in Kevdi (Zankhvav), Bedvan and Devmogra. It is said that the Muslim shopkeeper and landlord of Nal village was well accepted by the villagers. He was confident that his village folk would stand by him despite the warnings of the looters. One night the rioters appeared on the hill. The village folk pleaded helplessness and the Muslim shopkeeper managed to escape with his family on a tempo. The rioters looted furniture and other items. Some villagers preserved some of the belongings to be given to the Muslim villager when he returned. Unfortunately, the police caught these people and jailed them while the real looters escaped. It has been reported that similar incidents occurred in other villages. This discouraged the village folk from defending the Muslims.

Having looted and chased the Muslims from the villages, eyes were now set on the Muslims in Dediapada town. To mobilise the tribals rumours were spread in the villages that the tribals in Dediapada have been attacked by the Muslims. Tribals were mobilised first from Chikda, Ambavadi, Dapvan and Kodamba to march towards Dediapada with sticks and axes. On the way more people were forced to join the mob. The aim was to loot and burn all the Muslim houses in Dediapada. According to eyewitness reports the crowd was about 5,000-strong before it was stopped by the district superintendent of police and the assistant collector of Bharuch near Kakarpada village which is about eight km away from Dediapada. The crowd was so charged that the efforts by DSP and the assistant collector to disperse them peacefully did not work. As a result, shooting orders were given in which three people were seriously injured

and hospitalised. What would have been a great calamity for the Muslims of Dediapada was averted by the DSP and his men

Inciting Terror

From the chronology of events leading to loot and arson in these talukas it is evident that the religious leaders played a sinister role Person who galvanised these events were members of BSS, VHP and RSS. Prior to Ramshilapujan RSS training camps were held at various centres. Outsiders were brought to train the youth BSS has been operating since 1984 from its headquarters in Dediapada town This centre has acted as a platform for all the above-mentioned organisations to meet, discuss and hammer out their strategies.

The BSS centre was used by VHP, RSS activists and some businessmen. They indoctrinated the bhagats, sarpanchs, police patels and some primary school teachers who acted as links between the centre and the people. When these went back to their respective villages, they acted as indoctrinators of the youth. They called for a bhajan mandali and at the end, when women folk dispersed they assembled the youth. In these meetings, the Muslims were presented as destroyers of Hindu shrines, exploiters and scapegoats for the ills of tribals. The ejection and elimination of Muslims alone was proposed to be the solution. A local Marwari businessman from Dediapada supported the rioters though he did not belong to any organisation. It is said that he had his own business calculations behind driving out Muslim shop-keepers from the village.

BJP was actively involved in the riots. The sitting BJP MLA of Dediapada area was the brother-in-law of the BJP MP of Bharuch constituency. The villages in the vicinity of MLA's village witnessed loot and arson intensely There has been a close nexus between these politicians and the Hindu religious organisations mentioned earlier. These organisations prepared the ground with speeches, processions, audio and video tapes. Loot and arson was reported to have been undertaken under the remote control of the MLA. It is alleged that he brought outsiders from Amleta and Taropa villages near Rajpardi to demonstrate to the tribals how to carry out loot and arson. Though he was absent during these operations, his elder brother was moving about in disguise. He was nabbed by the police and jailed in Bharuch. Later, politicians secured his release

A posse of police and the Mamlatdar of Sagbara were silent witnesses to the loot and arson. Not only did they take no action but they took care to go to Gansera village (between Akkalkuva and Sagbara) to instruct people to put roadblocks so that the Muslims of Akkalkuva may not come to the aid of Sagbara Muslims. Akkalkuva is a border village in Maharashtra with a large Muslim population. The Mamlatdar was heard saying, 'vardi pan amari chhe' (even the police is on our side).

The police in Dediapada became responsible especially when the DSP and assistant collector came from Bharuch to visit the disturbed area The police nabbed some looters and jailed them in Bharuch. The Mamlatdar of Sagbara and the clerks of Dediapada and Sagbara taluka offices have played sinister roles during these riots.

The looting and arson was carried out mostly by the outsiders. However, it is said that some villagers who owed money to the Muslim shopkeepers found it convenient to indulge in loot and arson. Many co-villagers were sympathetic to the Muslims but as mentioned earlier, they could not withstand the onslaught of the crowd descending at night and terrorising the villagers. Those who sympathised with the Muslims were ridiculed and insulted as the offspring of Muslims.

The only local voluntary organisation in the area willing to help the affected people was the Christian missionary. They were paralysed as they were threatened that they would be next target after the Muslims. The slogan was 'kasai pachhi Isai' (after the butcher (Muslim), it's the turn of the Christians). A Muslim organisation set up an *ad hoc* office at Sagbara and Dediapada to help the affected Muslims. Government officials too came to assess the damage and paid some compensation to the victims.

Fall Out of Riots

The tribals have realised that looting is rewarding and hence, have become bold. Some youth feel that 'ame shakti batavi' (we showed our strength). Blocking roads and halting vehicles still continue. Earlier only Valia was considered to be a danger zone for vehicles in the night. Now the state highway passing through Dediapada and Sagbara talukas is also considered dangerous at night. Minor incidents of stone throwing and blocking roads at night are often reported. In September 1993 ten vehicles were looted by a group of about 25 armed men on the state highway between Sagbara and Dediapada town. The travellers, including children, were looted, beaten and wounded severely. The looters were later caught and almost all of them were found to be from the villages which took active part in the riots.

The growing boldness and aggression of the tribals is also sensed by the non-tribals in the area. During the year after riots a Patidar from Ambavadi was murdered and a youth belonging to Patidar family in Chikda was beaten by the tribals. As a result many Patidars from the villages of Sagbara and Dediapada, namely, Chikda, Bombay company, Piparvati and Ambavadi have sold their land and left.

During the communal riots, the tribals showed a sense of solidarity. Though they were instigated against the Muslims and the Christians alike, only the non-tribal Muslims were attacked. The tribal Christians had to pass through some tense moments but they were left untouched. In Sagbara town seven Muslim houses were burnt. But the tribal converts to Islam were spared.

The tribals have seen the game played by the Hindu communal forces. They were told that the Muslims are the exploiters and therefore they must be eliminated. Except one Muslim family in Dumkhal village of Dediapada, the Muslims from eastern border villages of Valia and from whole of Dediapada and Sagbara talukas have left their villages and have settled in Pat, Akkalkuva and Dediapada town, where Muslims are in large numbers. Now some tribals feel that they were used by some vested interests for their own political and economic gains. The situation continues to be the same as before for the tribals. Due to this realisation the riots that broke out after the demolition of Babri masjid failed to evoke any response from the tribals, in spite of various efforts by the VHP and RSS activists from Dediapada and Sagbara taluka centres. Rumours were used to create an appropriate atmosphere of hatred and to mobilise and instigate the tribals against the few remaining Muslims. A major rumour at that time was that 22 tribals from Khopi village of Sagbara taluka have been burnt

to death at a construction sight in Surat. The Muslim victims of Bedwan village who are now settled in Surat city were depicted as the culprits. The formation of peace committees after the 1990 riots and the precautionary measures taken by the police pre-empted the possible riots.

The tribals of Dediapada and Sagbara participated in the riots to a great extent. There was little or no response from the tribals of Valia taluka, barring a few border villages in eastern part of the taluka, even though the Muslims are spread all over the taluka as landlords, shop-keepers and moneylenders. Moreover, compared to Dediapada and Sagbara, the tribals of Valia are more Hinduised and are closer to urban centres like Ankleshwar and Bharuch.

For decades the Valia tribals have suffered under the economic and political domination of non-tribals, viz, caste Hindus and Muslims. For the last decade or so the tribals of Valia have begun to press their numerical advantage against the political manipulations of the non-tribals. The assertion of tribal identity, unity and the common experience of economic and political exploitation by the non-tribals has provided them a new sense of consciousness as the landless and suppressed class. This growing consciousness since the 1981 has not been a welcome development for the non-tribals. As a result, since 1981 the political history of Valia has been one of elimination of tribal leadership and the suppression of tribal voice [Adhvaryu 1981; Augustine 1984]. Nine tribal leaders have been eliminated since 1981 and many more silenced by force and false cases. Efforts are still on to suppress them further [Lobo 1993; Parmar 1993; Shah and Shah 1993]. Against this assertion, the caste Hindus, the Muslims, the bureaucrats, the politicians and the police not only have protected each other but also have succeeded in suppressing and dividing the tribals.

For the landless tribals of Valia there is no difference between a Hindu or a Muslim or a Parsi landlord. As the educated tribal sarpanch of Shir village put it 'Aa loko Babarthi kevi rite juda chhe?' (What way are these people different from Babar?) 'Babare Ayodhya padavi lidhun hoi to, aa lokoye amari jameen padavi lidhi chhe. Shun aa loko aa sadina Babaro nathi?' (If Babar has appropriated Ayodhya, these people have appropriated our land. Are they not Babars of this century?).

In Dediapada and Sagbara talukas the communal forces could succeed in directing the growing economic frustrations of the tribals against the Muslim exploiters and create an anti-Muslim economic base to promote their own economic and political interest. While though a more acute situation was present in Valia taluka, it looks as though the communal forces knew that use of a similar strategy would prove counter-productive in the long run. However, the sectarian movements have provided fertile ground for the spread of communal consciousness among the tribals and at the same time their incorporation into various religious sects and active promotion of 'Bhajan Mandalies' supposedly to promote or raise the so-called 'ethical standard' of the tribals seem to have blunted the class consciousness in the area.

As the above account suggests, the tribal participation in communal violence was not spontaneous, but rather it was planned and engineered. The communal forces have succeeded in cleverly making use of the economic dependency and frustration of the tribals. The region is agriculturally less prosperous mainly due to the hilly and rugged terrain. The tribals, particularly the landless and the migrants are undergoing a stress, economic as well as social. The caste Hindus and the Muslims, on the other hand, are predominantly settled farmers, landlords, traders, moneylenders, government officials and are in direct interaction with the tribal population, through trade, agriculture, marketing and administration.

Religious activity is quite intense among the Hindus as well as the Muslims. Among the Hindus there is a renewed upsurge in formation of different sects and ritualisation of social life in the region. As a result, the consolidation of Hindutva forces in the larger society and exhibitions of symbols, namely, Ramshilapujan, Ramjyot, Rathyatra, could create an environment of fervour even among the tribals in the region. The Hindu communal forces have been successful in incorporating some tribals into their game plan and systematically utilise them to humiliate and attack the Muslims. The tribal masses also are susceptible and can be mobilised on the basis of honour and emotions.

Observations indicate persistence of two tendencies among the tribals, either simultaneous or separate depending upon the strength and capacities of dominant Hindu communal sections. The first tendency is that of seeking legitimacy in a religious group other than their own (through various sects), and being a new comer and minority, exhibit their religiosity under the dictates of Hindu communalists. This new identity formation in making cannot be ignored.

The second and most significant tendency is that of alliance building across the ethnic barrier, but along the class lines. This alliance is often spontaneous but firmly based upon their historical experience of deprivation, exploitation and subjugation. It is for this reason there is a refusal among the tribals of Valia to join the communal forces. Rather, they identify both the Hindus and the Muslims as their enemies, because both are owners of land while the majority tribals are landless labourers. How long this secular solidarity remains alive and decisive in regional politics is a matter for separate investigation.

[This paper rightly or wrongly seems to assume that the tribals are not Hindus. The question of religious identity of the tribals is widely debated over the years by anthropologists. Around the time of independence, there was an interesting debate on the merits and demerits of the policies of isolation, assimilation and integration with respect to tribal societies of India. The post-colonial leadership said to have opted for an integrative strategy of development combining elements of protection and welfare, while Nehru's 'Panchasheel' (five principles) called to abstain from making the tribals a poor copy of the majority community and to allow them to develop along the lines of their own genius. But in practice while the tribal integration into the larger society is fervently pursued the tribals are made to feel inferior in the matters of their own lifestyle, art, craft, customs, folklore, dance, costumes, architecture, etc. Their culture is degraded and stigmatised. Their values are rejected as obscurantist. Their beliefs, rites and symbols ridiculed and religions are treated as superstitions. In whatever sense they are called the 'backward Hindus' such an attitude of the dominant society towards the tribal in turn has helped the communal forces to exploit the tribal sentiments and make use of their so-called 'cultural backwardness' and economic dependency to impose on them the 'superior forms' of religious and cultural practices. This may have provided a larger religious identity beyond the ethnic identity to tribals but in reality it amounts to elimination of cultural diversity by imposing the hegemony of the dominant society.]

Political Upsurge in Kashmir

Then and Now

Rekha Chowdhary

In contrast to the radical agenda of socio-economic transformation in the 1930s and the 1940s, the present stage of the movement for Kashmiriyat lacks ideology and vision.

UNDERLYING the present political upsurge in Kashmir, there lies a distinct conception of Kashmiri identity. Kashmiriyat, as this identity is commonly known, is a manifestation of cultural-linguistic bonds strengthened by a common heritage. Besides other historical factors, this heritage has been enriched by a tradition of intellectual and spiritual development over the centuries. Its geographical compactness has made it possible to maintain the uniqueness of Kashmir region which gets reflected in varied socio-cultural dimensions of day to day life of Kashmiri community. An overwhelming majority of Kashmiris share a common religion. Hence many observers emphasise Islam as an important factor underlying Kashmiriyat. Of course, there are instances when Kashmiri identity takes religious overtones. Yet, such overtones do not represent any consistent pattern. Hence Kashmiriyat can be better understood with reference to culture than religion.

From time to time, Kashmiri identity seeks political expression and assertion. This process results in political mobilisation of the masses and their emotional involvement around certain pertinent issues. The earliest instance of such political assertion can be found in the recent history, i e, during 1930s and 1940s. It was during this period that political consciousness of Kashmiris was organised and channelised in the direction of creation of a 'New Kashmir'. This was a period of political upsurge which is comparable to the present political upsurge, yet with significant difference.

The article aims to analyse the political movement in Kashmir during the 1930s and the 1940s with a view to understand the present situation in a better perspective. The two situations of political mobilisation are different but are an inter-connected manifestation of the same political psyche.

Formation of Muslim Conference

The political upsurge of 1930s and 1940s can be better understood against the backdrop of socio-economic and political conditions of that time. For past three and half-centuries, Kashmir had fallen victim to foreign aggressors – first the Mughals, then the Pathans, to be followed in turn by Sikhs and Dogras. The long-term impact of such political domination could be observed in the moral degradation as well as abject poverty of the Kashmiri masses. At the time when political consciousness started taking shape in Kashmir, the condition of both the peasantry as well as the class of artisans was pathetic. Walter Lawrence, the settlement officer, who made a detailed study of revenue and taxation system in Kashmir, pointed out that peasants were crushed under the burden of taxes. He recorded that when he started settlement of land, everything save air and water was under taxation [Lawrence 1895]. Peasantry possessed no land and worked under tenancy. The landlords managed the land which belonged to the ruler, by law. In addition to the revenue of land, which was of an exortionist and unsettled nature, the peasants were also subjected to the payment of various other kinds of taxes - taxes on commodities like milk, fruit, grain, honey, wool and other household items. The class of artisans, comprising of shawl weavers, carpet weavers, wood carvers and workers in silk factories, were also heavily taxed. Most oppressive was the system of 'begar' (forced labour). Under this system, many Kashmiri villagers, year after year, were required to toil as carriers of burden to far off areas [Saraf 1977; Ahad 1987].

The discontented masses generally suffered in silence. Yet, attempts were made to organise resistance from time to time, howsoever of limited nature. Thus, for instance, in 1847, shawl weavers went on strike protesting against heavy taxation policy of Maharaja Gulab Singh. In 1865, shawl weavers demonstrated and demanded increase in wages. The silk factory workers came out on the streets in 1925 against the oppressive working conditions [Saraf 1977:237]. But it was only in 1930s that the Kashmiri political consciousness took an organised form when young, educated Muslims acquainted with the ongoing national movement in the Indian sub-continent, formed the Muslim Reading Room in Srinagar in 1930. Soon after its formation, it became a nucleus of political activities in Kashmir. Gradually, the organised political activities started gaining momentum in Kashmir. This led to the formation of All Jammu and Kashmir Muslim Conference in 1932. The Muslim Conference was limited in its goals and ideology. It was an organisation with the declared objective of redressing the grievances of educated Muslims, especially with regard to their entry into government employment. However, as the political consciousness became more widespread, it broadened its objectives and the leaders of the Muslim Conference played an important role in organising masses and launching struggle against the existing system of monarchy. The demands of this organisation, thereafter, related to the establishment of a democratic form of government, a directly elected legislature, the bill of rights including fundamental rights and basic civil liberties such as freedom of press, speech, platform, association, movement, assembly, religion, etc [Khan 1980].

The fact that Muslim conference had a declared objective of working in the interest of Muslims, had no substantial bearing on the nature of political movement in Kashmir. The political consciousness in the valley was rising above parochial limitations and assuming a rather radical character. Radicalism entered the Muslim Conference as well. By 1934, a group of progressive leaders had formed a strong left wing faction of this organisation [Khan 1980:327]. Meanwhile, a number of radical organisations representing the interest of oppressed peasantry, labouring class, youth, etc, were organised in the state, especially in the period after 1933. A number of youth organisations sprang up under the guidance and direction of progressive leadership operating within and outside the Muslim conference. These organisations included the Kashmir Youth League, Kashmir Students Union and Kashmir Students Union League. It was during the same time that Mazdoor Sabha was formed and various associations of workers and artisans, such as the Kashmir Motor Drivers' Association, the Tonga Drivers' Association, the Carpet Weavers' Association, etc, were brought under its banner. The Mazdoor Sabha became a force to reckon with. Soon after its formation, it organised an impressive joint procession of peasants and artisans. The same year, Kissan Sabha was organised with the avowed objective of bringing all the peasants under one banner.

The Muslim Conference could not remain unaffected by the radicalisation of Kashmiri political consciousness. Already it was getting stifled by its narrow communal identity. A part of its leadership, from its very inception, desired the organisation to broaden its membership structure to include like-minded non-Muslims. Sheikh Abdullah had established close contact with the emerging non-Muslim leadership in the state. Thus, when the Muslim Conference observed May 8, 1936 as 'Responsible Government Day', as the president of this organisation, he appealed to Hindus and Sikhs for support

and co-operation for the movement by participating in it [Kaul 1985:16]. It was due to his efforts to broaden the outlook of this organisation that in its 6th annual session the Muslim Conference declared, "Like us, the large majority of Hindus and Sikhs in the state have immensely suffered at the hands of irresponsible government. They are also steeped in deep ignorance, have to pay huge taxes and are in debt and (are) starving" [Pandit 1980:195].

Naya Kashmir

In response to such radicalisation both within and outside the organisation, the Muslim Conference converted itself into the All Jammu and Kashmir National Conference in 1939. Its membership was now open to all communities. A number of prominent non-Muslims like Sardar Budh Singh, Pandit Jia Lal Kilam, Kashyap Bandhu and Pundit Prem Nath Bazaz, were included into its working committee.

The most important contribution of the National Conference towards the articulation and channelisation of Kashmiri popular aspiration was the adoption of the 'New Kashmir Plan'. It was the blueprint of this organisation to build a new Kashmir society, economy and polity. It called for an 'all-sided advance along all avenues of human activity regulated in a democratic manner on a country-wide scale' (*The Kashmir Manifesto*, pp 22-24).

The 'New Kashmir Plan' had two parts. The first part dealt with the proposed constitutional structure of the state and the second part with the 'National Economic Plan'. The constitutional structure of the state was to be based on the party's vision of a political system following the 'democratic principle of responsible government with the elective principle applied from the local panchayats right up to the legislative assembly'. The plan envisaged the establishment of rule of law and equal protection of law for all citizens and recourse to quick, cheap and impartial justice, the establishment of legislature to be elected on the basis of adult franchise, the establishment of peoples' courts in all districts and tehsils with the high court at the apex of the judiciary the right of women to elect and to be elected in all the institutions on the basis of equality with men, equal opportunity for all children, right to free education to all students, etc.

The 'National Economic Plan' envisaged a radically new rural economy. It suggested fundamental changes in prevailing land relationships. More specifically, it proposed a system of planned economy ensuring the people a reasonable standard of living, reorganisation of agricultural relations with emphasis on the principle 'land to the tiller', establishment of co-operative associations for cultivators, peoples' control over forests, industries, banks, regulation of the price level and fixation of wage bill, etc. The plan envisaged setting up of various 'National Councils' including those concerning with agriculture, public health, education and housing. To the plan were attached three charters, first for peasants, second for workers and third for women.

An analysis into the background and the nature of the movement during 1930s and 1940s points to a definite socio-economic content. The movement arose and centred primarily around the issues concerning peasants, artisans and workers. It was on the basis of such a direction of the movement that later the National Conference government could put into practice various radical measures proclaimed in the 'Naya Kashmir' plan. These measures were primarily aimed at alleviating the condition of the rural poor. Jagirs and big landed estates were abolished and ceiling was placed on the possession of agricultural land. Old debts amounting to millions of rupees were liquidated, cottage industries were subsidised and small entrepreneurs were helped financially to start small-scale manufacturing units [Jammu and Kashmir Government nd]. The progressive nature of the movement can be assessed from the progressive nature of land reforms which have been widely acknowledged as one of the most radical and most effective in India. Wolf Ladjensky compares the land reforms in Kashmir with those implemented in other states and observes, "whereas virtually all land reforms in India lay stress on the elimination of the zamindari tenure system with compensation or rent reduction and security of tenure, the Kashmir reforms call for the distribution of land among tenants without compensation to the erstwhile proprietors; whereas land reform enforcement in most of India is not so effective, in Kashmir, enforcement is unmistakably rigorous..." [Ladjensky 1977:179-80].

The movement, on the whole, was positive in nature. The masses identified with it on ideological grounds. It contained within it a vision of a new Kashmir – a Kashmir that would not merely spell prosperity to few privileged Kashmiris but that which would fulfil the aspirations of the masses – the downtrodden, deprived and marginalised masses.

Devoid of Vision

Much water has passed under the bridge since the 'Naya Kashmir' movement of the 1930s and the 1940s. The present generation of Kashmiris stands disillusioned both by the vision of Naya Kashmir as well as the organisation that gave this vision to the people. At present, there is a complete breakdown of political processes in Kashmir. The absence of politically relevant actors and agencies has created a political vaccum. The political parties have been replaced by the militant outfits which have mushroomed in the valley since 1989. The emotions of people are once more surcharged and a movement like situation exists once again in Kashmir. But this time there is no vision of a 'New Kashmir'. Nor there is any economic or political charter to inspire the masses. The movement, in fact, does not have any economic content. It does not go into the question of socio-economic realities and evades the whole issue of class contradictions. It presents the Kashmiri society as one monolith, close-knit and unified structure.

In the absence of any ideological basis the support which the movement gets from the masses is purely emotional. To some extent, passions have been aroused around the Islamic identity of the Kashmiris. Fundamentalism has entered Kashmiri consciousness, though not in a big way. But more than religion, what unites Kashmiri people emotionally with each other and with the ongoing movement, is a sense of complete alienation which has been channelised in the direction of anti-India sentiments. These sentiments have accumulated as a result of a long and deliberate process on the part of Kashmiri politician to camouflage the real basis of mass discontent. Discontent has its roots in economic and political conditions in the post-independence period. Similar discontent was visible in the rest of India as well. But it took varied shapes like politics of regionalism, naxalism, assertion of ethnic identities, reorganisation of marginal groups, grass roots movements, etc. In Kashmir, there has been only one response: for everything that went wrong politically and economically, India has been held responsible. It suited those in power to shift the blame onto an abstraction named 'India'.

If we go beyond what appears on the surface, we will find that the alienation of Kashmiris has deep-rooted economic basis. The post-independence Kashmiri society saw the emergence and consolidation of new economic forces which formed the basis of later discontent.

The agrarian reforms had, no doubt, brought about substantial change in the land relationships in Kashmir. Yet, a number of traditional landholders had managed to retain land. These traditional landholders later emerged as a powerful land-owning class garnering all the benefits meant for the peasantry, including subsidies, grants and loans under various horticultural developmental schemes. Meanwhile, new opportunities provided by the developmental forces created a class of *nouveau riche*, an urban middle class. This class, like its rural counterpart, absorbed most of the benefits of schemes and programmes aimed at the

amelioration of general masses [Punjabi 1992:142-43].

Mid-1950s and 1960s saw an era of hectic economic activity in Kashmir. It was during this period that central aid made all round progress possible in the state. New roads were constructed, hydro-electric projects were launched, tourist industry was given a new vigour and there was a rise in the production of handicrafts. Prosperity certainly arrived in Kashmir. But it was prosperity of few. These few affluent Kashmiris along with politicians and bureaucrats adopted a life style much different from the rest of masses. "At the top of this society" notes Riyaz Punjabi, "was firmly saddled a small competitive class, for whom fierce competition for grabbing anything that came their way, became an avocation. In order to accord legitimacy to the new social order, the *nouveau riche* started seeking kinship ties with the 'Shurra' by entering into matrimonial alliances with them. After integrating these strategic high social castes with the new order, most of the *nouveau riche* changed their castes and surnames to indicate their higher social status through heredity. It was a long-term strategy to avoid identification in case of further dramatic change in the socio-economic conditions of the state" [Punjabi 1992:143]. The wide gulf between those who monopolised the fruits of prosperity and those who remained deprived and untouched by developmental schemes and funds brought about slowly a creeping feeling of dissatisfaction. This feeling was further intensified by the generally prevailing corruption and unscrupulousness.

Discontent needs to be channelised and expressed in a democratic manner. The political parties are the most important agencies which can articulate and channelise the discontent in legitimate direction. A healthy party competition, thus, is a prerequisite of a working democracy. Deplorably, Kashmir, somehow, could not evolve a tradition of healthy party competition. For, both the National Conference and the Congress had sufficient scope and space to operate in the political arena and to keep Kashmir politics on a democratic course, provided both the parties stick to the norms of healthy competition.

The National Conference which had come into existence with a vision of total reconstruction of Kashmiri society, lost its moral fibre sometime after it came into power. Corruption entered its rank and file. Sycophancy, nepotism, favouritism and other malpractices soon damaged the credibility of the Party. In its desire to cling to power, it went in for all sorts of compromises and adjustment with the Congress party. These compromises contributed to the growing unpopularity of the National Conference. Thus, it was the 'unholy' alliance between the National Conference and the Congress, under the Rajiv-Farooq accord before 1987 assembly elections which ultimately proved to be the death-knell for the National Conference.

The only other political party which could have played any role in Kashmir politics was the Congress. It could have provided a healthy opposition to the National Conference thereby providing an avenue for the release of discontent democratically. But the Congress could never accept itself as an opposition party in the state. Its hold over power in the centre made it possible to manouvre the politics of the state as well as the politics of the National Conference. It allowed the National Conference to operate only if it made sufficient space for the Congress in the power structure. Alternatively, it engineered merger of the National Conference into the Congress under the leadership of G M Sadiq when the National Conference ceased to exist for about a decade, encouraged defections in the legitimately elected National Conference government (as in 1984 the Congress toppled the National Conference government by engineering defections and later supporting the G M Shah's government); or induced the National Conference to go in for election alliance even when the latter did not require such an alliance (as in 1986 when Farooq Abdullah went in for an alliance with Rajiv Gandhi-led Congress when the image of the Congress was at its lowest).

The political impasse brought about by the failure of the National Conference and the Congress has long-term implications for Kashmiri society and politics. It is a society which is being regulated by the logic of terror. Politics has taken a back seat and there is no possibility of normal political processes being restored in the near future, not only because the National Conference has become a spent force and cannot occupy the central space of Kashmir politics, but also due to the fact that the very institution of political party has suffered a severe setback in the present political crisis. In the absence of an organised political party capable of acting as an effective mediating agency, the very concept of participatory politics is at cross-roads.

For a movement to be dynamic, it is essential that it should be positive and should be led by an organisation and leaders capable of providing such dynamism to the movement. This was exactly the case with the movement of the 1930s and 1940s. The evolution of the movement coincided with evolution of an organisation which kept on broadening itself from a narrow parochial base to a wider progressive one. The present political movement is limited on both these counts. Neither it has any positive basis for its continuance nor it is led by an organisation capable of occupying the central political space. It is more of a negative nature with 'anti' feeling and hostile sentiments. There is no political platform through which organised political opinion could be channelised. 'Hurriyat', an amalgam of semi-political, religious, terrorist organisations and ex-political parties, is too feeble and too divided to provide such a political platform. In spite of its existence on Kashmir scene for some time now it has failed to become a political force capable of either directing the movement or providing an organisational structure to it.

It is a hopeless situation in Kashmir: the central government is finding no mediating agents to restore political processes, the masses are trapped between the terror of militants and fear of security forces, the terrorist outfits are finding it difficult to continue the Kashmiri upsurge merely on the basis of gun, religious emotions and anti-India feelings, and erstwhile politicians are finding no ground under their feet. In such a situation of impasse, resurrection of 'Naya Kashmir' may be a difficult but certainly not an impossible exercise. For what has become irrelevant for Kashmir is the National Conference, but not the vision which it represented in the 1940s. The process of reconstruction of Kashmiri society is still an unfinished job. It is difficult to suggest how this vision can be actually resurrected, but one thing can be clearly stated that without such vision, the Kashmiri movement will lose its momentum and the Kashmiris will remain besieged by the logic of terror and counter-terror.

War and Peace in Sri Lanka
Government's Reform Proposals and Beyond

Sumantra Bose

In attempting to reconstruct Sri Lanka as a Union of Regions rather than, as social and political realities demand, a Union of Peoples, the government's proposals may fail to mollify hardline Sinhalese nationalist opinion even while falling short of fulfilling Tamil aspirations.

THE constitutional reform proposals presented by the Chandrika Kumaratunga government have been broadly welcomed in Sri Lanka, India and internationally. This generally positive response is in itself not unexpected or inexplicable. When one of the parties to a seemingly intractable and interminable civil war, which has exacted a horrifying human toll, finally puts forward a detailed blueprint for a political resolution of the stalemated crisis, a certain level of optimism is neither avoidable nor unwarranted. Yet it might be prudent to temper that optimism with a good measure of circumspection and even a sizeable dose of scepticism. First of all, there is the perhaps unfortunate but nonetheless inescapable reality that any 'peace process' in Sri Lanka that does not involve the participation, in a central role, of the Liberation Tigers of Tamil Eelam (LTTE), is likely to remain an exercise in futility. The relapse into massive violence that has followed the breakdown of the cease-fire on April 19 is a maximally unfavourable context for peace-making efforts of any kind. Prospects of a change for the better in the foreseeable future appear dim, since both belligerents seem committed for the time being to a trial of military strength.

But uncompromisingly hardline positions and a grim context of full-scale warfare are not the only impediments to a lasting peace in Sri Lanka. The flurry of accolades that have greeted the government's set of proposals have detracted from probing critiques of whether these proposals do, in fact, constitute an optimally adequate, appropriate and effective approach to the core problem of Sinhalese-Tamil relations in modern Sri Lanka. With the Colombo government having more or less successfully appropriated the mantle of 'democracy' and 'progress', as well as the rhetoric of equality and justice (largely thanks to the LTTE, which seems to have no sense of public relations whatsoever), there is a risk that any doubts voiced about whether the proposed reforms constitute the antidote to the ethnic conflict will get dismissed as Sinhala-extremist-reaction or Tamil-intransigent-rejectionism. Yet there do appear to be a number of serious questions about the viability and promise of these proposals as the basis for a lasting peace in Sri Lanka.

Union of Regions

The basic model for the government's plan appears to be the aborted Bandaranaike-Chelvanayakam (B-C) Pact of 1957. Much like the present plan, the B-C Pact envisaged wide-ranging decentralisation of administration and devolution of powers to one or more regional authorities to be established in the Tamil-majority North and East. The regional body (or bodies) were to be entrusted with a range of subjects, including agriculture, co-operatives, land settlement and development, education, health, industries, fisheries, housing and social services, electricity, irrigation schemes and roads. The regional council(s) were to have the right to tax and borrow to finance projects in their fields of responsibility, and in addition, the central government was charged with providing a certain level of funds from the state's general revenue. To reduce linguistic discrimination, the Pact further stipulated that Tamil should be the official language of all administrative work in the northern and eastern provinces.

Many aspects of the latest proposals bear a striking resemblance to this framework of devolving responsibility in most spheres of everyday governance to regional authorities, while retaining certain critical powers at the 'centre' and ensuring linguistic impartiality. However, the current proposals are wider in scope than the B-C agreement, in that they seek to parcel out the entire island, not merely the north-east, into a cluster of regionally organised administrative entities. There are some echoes in the document of other past agreements as well. For example, the clause that 'priority in future land settlement schemes will be given to persons first of the district and then of the region' is directly derived from a similar provision in the unimplemented Senanayake-Chelvanayakam Pact (1965) which was intended to defuse the sensitive issue of state-sponsored 'colonisation' of Tamil-dominated areas in the North and East. But overall, the present reform proposal is more a descendant of the B-C Pact than anything else. Its reach and scope put it in a league quite apart from the 'Indo-Sri Lanka Accord' of 1987, which, for all its grandiose pretensions, merely granted the Tamils limited and conditional concessions within the framework of an explicitly unitary state.

Ironically, it is the broad sweep and overarching design of the reform proposal that may turn out to be its Achilles' heel. Though rather self-evident, it may still be worth pointing out that the conflict in Sri Lanka is not between 'regions', but between the nationalist consciousness and agendas of two distinct peoples, who, while sharing many legacies and interests in common, also have some very difficult political problems to sort out with each other. In principle, there is no harm in itself in meshing broader democratising reforms in Sri Lanka with a programme for resolving the key 'national question' – indeed, given the intimate connection between the two issues, such a strategy makes a lot of sense. But there is a problem in the government's apparent inability or unwillingness to explicitly acknowledge the absolute centrality of the 'national question' to Sri Lanka's future, and in its apparent subordination of the proposed resolution to that question to a scheme of administrative reorganisation (however 'far-reaching').

Very simply put, the conundrum is this. What are the Tamils (who, according to Sri Lanka's president, "have genuine grievances to which solutions must be found") getting from this deal that the inhabitants of the central province, the western province, or Uva or Sabaragamuwa provinces, also not getting? The president's explicit denial that her government's proposals are 'federal' in nature is both rather ridiculous and somewhat disturbing. Above all, it smacks of a tendency to evade or sidestep the political essence of the problem, and instead reduce it to administrative-legal terms (this, incidentally, was the crippling flaw in the Austro-Marxist Karl Renner's otherwise excellent work on the issue of nationalities in the Habsburg Empire).

If the proposal is couched in such overarching, sweeping terms partly or largely as an elaborate charade, i e, in order to pre-empt and deflect hardline Sinhala nationalist opposition, the subterfuge is so transparent as to be positively useless. Hardline Sinhala nationalists may be narrow-minded and obsessive, but they are not idiots. Indeed, any suspicion that the government is 'giving in' to Tamil demands under cover of some grandiose devolution project is likely to increase, not reduce, the habitual paranoia and alarmism of this constituency.

Certainly, it is difficult to find fault with any effort to strengthen institutions of lower-tier administration and grass roots governance in Sri Lanka. Indeed, there is yet considerable space for expanding the role and arena of responsibility of the provincial councils in the overwhelmingly Sinhala regions of the country, where, unlike in the war-torn north-east, they are functional organs of government. But it is hard to

discern what tangible benefits can be derived by dividing up the entire country in this manner into regional units – indeed, there is a possibility that this may spawn bloated and unnecessary bureaucratic and political establishments at the 'regional' level.

This manifest overkill on 'regionalisation' is all the more odd because there is hardly any popular demand for such changes in the Sinhala-majority areas. The last time a major proposal was mooted to constitute Sri Lanka as something of an 'Union of Regions' was in 1927, when the Kandyan Sinhalese chiefs petitioned the British to set up three autonomous regions within the framework of a quasi-federal polity – the units being the Tamil-majority North and East, the Kandyan Sinhalese highlands and adjacent areas, and the low-country Sinhalese lands of the western coast and deep south. At the time, this was a reasonable proposal worthy of serious consideration (it was turned down). But things have changed very dramatically since then. While a pan-Sinhalese identity has been consolidated in the post-colonial period (as one scholar has written, 'low-country and Kandyan Sinhalese are inextricably mixed up today'), it is the antagonism between Sinhala and Tamil collective identities that has emerged as by far the most salient division in modern Sri Lanka.

In attempting to reconstruct Sri Lanka as an 'Union of Regions', rather than, as social and political realities demand, a 'Union of Peoples', the government's proposals may run the risk of falling between the cracks. In other words, they may fail to mollify hardline Sinhalese nationalist opinion (the opposition United National Party has, predictably, adopted a wait-and-watch policy on the proposals, while Buddhist clergymen are already raving and ranting against them), while falling far short of Tamil aspirations that they be recognised as a 'nationality' with a 'historical homeland'. There is, of course, a very important territorial/regional dimension to the Tamil claim to 'self-determination' (indeed, this is the crux of the conflict in Sri Lanka), but the issue is far too thorny and complex to be dealt with as an administrative reshuffle, and that too in which the Tamil autonomous entity comprises only one of eight such units. There is also no hint in the proposals of the possibility of 'asymmetrical federalism' (as in Canada, where Quebec enjoys the status of a 'distinct society' within the Canadian federation), which may go some way towards meeting Tamil claims to a distinct identity and to self-rule as a people.

There may thus be a basic flaw in the structure and emphasis of the government's 'package'. The reform proposal is an interesting and innovative one, but it would be better-suited to a society composed of a multiplicity of territorially-based ethnic and linguistic groups (as in, say, India). Indeed, those concerned with a rejuvenation of Indian federalism and more equitable centre-state relations in India should find this document to be of considerable interest. But it is not optimally geared to the specific challenges of the Sri Lankan situation, where a protracted armed conflict between two highly articulate and organised groups (one identifying with the state, the other violently opposed) has fostered a highly regrettable situation (which, hopefully, will not endure forever) of political polarisation along ethnic lines.

Security Issues

Reservations can also be raised about specific recommendations in the peace proposal. Paramount among these is the question of physical security, for all communities in Sri Lanka but especially for the Tamil population of the North and East, who have borne the brunt of the descent into violence since 1983. According to the draft document, 'defence' and 'national security' remain under the exclusive jurisdiction of the central government. This is simply too glib to pass muster. A durable peace settlement is not possible in Sri Lanka in a scenario in which the central state authority wields a monopoly, or near-monopoly, of police and military resources. Indeed, a major reason for the LTTE's growth and popularity among the Tamils is its effectiveness as a deterrent and retaliatory force to the violence of the (almost entirely Sinhala-Buddhist) armed forces. Most ordinary Tamils harbour a deep-seated fear of the 'Sinhala army' – the mass exodus of Tamil civilians from those areas of the Jaffna peninsula into which the army temporarily advanced during 'Operation Leap Forward' was not exactly a thundering statement of confidence in the state's forces.

They are thus unlikely to be willing to entrust their 'defence' and 'security' exclusively to an army, navy and air force at whose hands they have suffered immensely, and which they believe is systematically biased against them as a people (episodes such as the recent sordid revelations about the gruesome murders of several dozen Tamil civilians in the Colombo area by killer squads comprising army, military intelligence and police-commando personnel can only reinforce Tamil apprehensions). A 'regional police force' whose head will be appointed by the president 'in consultation' with each region's chief minister, and which will remain subordinate in important matters to a 'national police service' controlled by the central government, is just no substitute for effective and adequate security guarantees. One long-term solution may be to drastically reduce the size of the armed forces, and change their composition to reflect the multi-ethnic makeup of Sri Lanka's society. But this will have to await serious progress towards peace. In the meantime, there are rumours that Kumaratunga has informally agreed to the formation of a Tamil 'regiment' or 'brigade' in the army. Apart from the fact that one Tamil military unit will scarcely make any substantive difference, there is the question as to who will be recruited into such an unit. If any attempt is made to formalise the existing co-operation between the army and remnants of several anti-LTTE Tamil groups by creating a 'Tamil brigade' out of these latter elements, this is likely to be a farce, and a rather dangerous one at that.

There are also indications that there may be some not immediately obvious riders discreetly attached to the proposals. It has been reported, for instance, that though the regional councils are generally to be left to their own devices, 'the president is expected to have powers to impose federal rule in case a regional government is found to be promoting 'an armed rebellion or insurrection'. Apart from opening a window to manipulation of regional governments from the centre, this seems to betray a deeply ingrained distrust among officialdom in Colombo of Tamils in general. It is unlikely that a modus vivendi can be reached in a climate in which Tamils continue to be regarded as a bunch of unpatriotic, untrustworthy secessionists.

Then there is the rather nebulous and indeterminate position, in the proposals, of the 'Tamil homeland' – itself a defensive and somewhat problematic political construct, but nonetheless deeply rooted by now in the Tamils' collective psyche. The integrity and indivisibility of this 'homeland' (i e, the North and East) is the sacred cow of Tamil politics, and a 'non-negotiable issue' to almost every Tamil organisation, including the LTTE. All that the reform proposal undertakes in this regard is that "one of the [eight] Regions will be constituted by redemarcating the existing boundaries of the present North-East Province with a view to reconciling Sinhala, Tamil and Muslim interests".

If 'redemarcation' and 'reconciliation of interests' implies redrawing of borders, this issue is likely to be a major stumbling block. Firstly, a partial dismantling of at least the most recent Sinhala settlements in the North and East would be necessary to assuage Tamil concerns about state-sponsored 'colonisation' of their 'homeland.' Of particular significance in this regard is the future of Weli Oya, a settlement complex established in the North, near the junction of Mullaithivu and Trincomalee districts, with the express purpose of disrupting the territorial contiguity of the north-eastern region. While some other settlement schemes may be subject to negotiation at some future date, if and when better sense prevails on all sides, the continuation of Weli Oya in this form will in all probability be inadmissible to almost the entire spectrum of Tamil political opinion. The recent failed Tiger attack on Weli Oya, while a military setback for the rebels, may well have earned them not inconsiderable political and propaganda points with their constituency.

The fact that a couple of hundred Tamil boys and girls gave their lives trying to take out the single most hated symbol of 'colonisation' cannot have failed to arouse a chord of sympathy even among Tamils who have deep misgivings about the LTTE.

The other crucial question in this regard is how to assure the security and rights of the Tamil-speaking Muslims, the largest minority group in the North-East (17 per cent of the North-East's population as a whole, a full third in the eastern province). The government apparently plans to tackle this problem (and placate its coalition partner, the Sri Lanka Muslim Congress) by detaching Amparai district, which has a Muslim plurality, from the rest of the east coast and carving out a Muslim council of some kind in this district. There are several problems with this approach. Firstly, it will enrage Tamil nationalists no end, and possibly precipitate further Tamil-Muslim bloodshed (the Tigers are a force to reckon with even in Amparai, and neighbouring Batticaloa district has a Tamil majority of 70 per cent).

But more importantly, this policy cannot be a viable solution to the status of the Muslim community in the North-East. The pattern of Muslim settlement in the eastern districts of Batticaloa and Trincomalee, and in the northern district of Mannar, resembles a series of quite non-contiguous blotches on the map of the North and East. In most of these places, moreover, Tamil and Muslim communities live cheek by jowl in highly mixed areas – for example, the volatile coastal town of Kattankudi in Batticaloa, which has a Muslim majority, is surrounded on all sides by Tamil-dominated villages. It is thus not possible to reconcile Muslim and Tamil 'interests' through 'redemarcation', at least not without making a complete mess of the geographical coherence of the eastern province and the mixed zones of Mannar. Some other formula for Tamil-Muslim coexistence has to be found in the longer term. One option might be to explore the creation of a network of autonomous municipal and cantonal assemblies and administrative organs in the Muslim-dominated pockets, with specified powers and responsibilities within the framework of a 'Tamil Autonomous Region' governed by a 'Tamil National Authority'.

In any serious negotiation process, the status of Trincomalee port, the prize of the east coast, would be yet another major point of contention. At the moment, the government's 'package' solves (or rather avoids) this issue at the stroke of a pen, by decreeing that 'international ports and harbours' will remain under central control. This is not a satisfactory resolution. Some kind of middle ground will eventually have to be found between Tamil fears that they will be left with a truncated 'homeland' minus its economic hub, and Sinhalese anxieties that the Tamils will seek to monopolise the benefits of Trincomalee harbour. As a long-term arrangement, there does appear to be a case for some mechanism of joint control over Trincomalee.

Finally, the government's proposals focus almost exclusively on the notion of decentralisation to administrative regions, to the neglect of reconfiguring institutions of executive and particularly legislative power at the central level so as to better reflect Sri Lanka's multinational reality. This is not a trivial or inconsequential matter. The major reason that Tamils are so obsessively attached to the idea of territorially defined autonomy, or to outright independence, is that they have been systematically frozen out of power-sharing at the central level by the Sinhala-Buddhist elite ever since the 1950s. The rules of Westminster-style parliamentary politics have been twisted and manipulated in such a manner as to result in the permanent marginalisation of Tamils from decision-making. This can only be rectified to a limited extent by proportional representation in parliament – the minorities (Sri Lankan Tamils, the Tamil plantation workers and the Muslims) together account for barely a quarter of the population, and they are deeply divided. Given this demographic configuration, PR in itself cannot offset the possibility of anti-minority rule in the name of the Sinhala-Buddhist majority, nor can it ensure an effective voice to each of the communities of Sri Lanka.

That purpose would be far better served by expanding parliament into a bicameral institution, in which a 'House of the Peoples' would be created with equal representation from the Sinhala, Tamil and Muslim communities. Most multinational states worldwide have some such institution: Sri Lanka is a stark exception. This chamber could be entrusted with mediating and arbitrating any inter-community disputes, and vested with the authority to accept or reject proposals to change the confederal constitution of the state. As of now, the government, fully in keeping with its administrative-legal approach to political questions, and its penchant for setting up 'commissions' at the drop of a hat on every conceivable issue, proposes to entrust the task of mediating disputes between the centre and the regions, and among regions, to an appointed 'Permanent Commission on Devolution.' It would be much more useful and democratic to give this responsibility to an elected upper house of parliament in which all communities have equal representation. Not only would this be a check on the reassertion of hegemony by the Sinhala-Buddhist oligarchy, but it would potentially give the Tamils a stake at the 'centre.' Other gestures, even if mostly symbolic, could help reinforce that stake. For example, it can be constitutionally mandated that if the president is Sinhala, the prime minister must be Tamil, and vice versa (a major improvement on mother-daughter teams), and that sessions of the bicameral parliament should rotate between Colombo and Jaffna.

Most of the omissions and shortcomings in the Kumaratunga government's reform proposals stem from one source: that they are, by and large, an unilateral declaration of intent by one party to Sri Lanka's conflict. Sri Lanka does need to be transformed in order to be saved, but the basis for such a transformation can only be laid through extensive consultation and negotiation between the main parties to the conflict. Applause from members of the 'intellectual' stratum in Colombo is not really worth very much – history suggests that some (not all) of these elements stand ready to endorse anything that those in office may choose to do at any given time (some of these elements even hailed the Rajiv-Jayewardene deal as a revolutionary breakthrough, and then remained conspicuously silent about the reign of terror and repression unleashed on the Tamils by the Indian army in the guise of 'peacekeeping'). Nor is the approval of the small Tamil groups based in Colombo worth much. Bereft of organisational strength, political credibility and popular support, these groups have little capability to be effective spokesmen for Tamil interests. When the veteran leader of the Tamil plantation workers, S Thondaman, asserts that 'Tamils who seek success in a political arrangement have an obligation to concede the leading role of the LTTE', he presumably means that were it not for the struggle waged by the LTTE, the Tamil nationalist movement would be insignificant and there would be no question of devolution proposals of any kind.

It is bitterly ironic, therefore, that the one Tamil movement that does have very significant clout and bargaining power has decided to renounce the path of dialogue, and reverted instead to the pursuit of a costly and high-risk war option. The Tigers may be able to hold their own militarily in 'Eelam War III.' They are an extraordinarily resourceful and resilient force, and have demonstrated a most impressive capacity to withstand and survive challenges and setbacks. Moreover, their strategic war-making capabilities have been greatly enhanced by the stupendous growth since 1991 of their naval wing, the Sea Tigers (who have established effective control over most of the coastline and high seas off the North and East), and by their acquisition and deployment of surface-to-air missile systems. The Tigers are now capable of mounting ambitious strikes and operations integrating their land and marine forces, and of partly neutralising the government's air power. Both these developments will have a major impact on the military balance on the ground.

But as I pointed out in my earlier article, there are certain constraints and dilemmas that the Tiger leadership can ignore only at its own peril. Firstly, especially because of

CALL FOR PAPERS

NIEPA

ANNOUNCES A TWO DAY CONFERENCE ON

REFORMING SCHOOL EDUCATION

Issues in Policy Planning and Implementation

(February 1-2, 1996)

The conference will deliberate on the following themes:

- Decentralised planning and management of education
- Revitalization of educational management
- Financing and resource mobilisation
- Alternative schooling
- School effectiveness
- Vocationalisation of secondary education

Papers are invited on the above themes. Abstract (not exceeding 250 words) and the full length paper (5000-6000 words) will be accepted tili December 15, 1995.

For registration and information contact:
Director,
National Institute of Educational Planning and Administration,
17-B Sri Aurobindo Marg, New Delhi 110 016.
Phone: 665472, 6969245
Fax: 6853041

CENTRE FOR RESEARCH IN RURAL AND INDUSTRIAL DEVELOPMENT

SECTOR 19A, MADHYA MARG
CHANDIGARH 160 019

Applications are invited for the following posts in the Population Research Centre sponsored by the Ministry of Health and Family Welfare, Government of India at CRRID.

Senior Research Officer: Pay scale Rs. 3700-5700 plus usual allowances.

Qualification and Experience: Good academic career with at least high second class post graduate degree in Demography/Population Studies/Economics/Population Geography/Sociology. Ph.D or published work of equivalent standard with at least eight years teaching/research experience at a senior position in Population Studies/Demography. The job requires extensive field work.

Research Assistant: Pay scale Rs. 2000-3500 plus usual allowances.

Qualification and Experience: Good academic career with at least high second class post graduate degree in Anthropology/Economics/Geography/Population Studies/Psychology/Sociology/Statistics. Those with specialisation in Demography/Population Studies will be preferred. Two years of experience in social science research relating to collection, analysis and interpretation of socio-economic data is desirable.: The job requires extensive field work.

Application on plain paper specifying the details of age, examinations passed, subjects taken, marks secured, year of examinations, board and university, publications, experience, current employment, references etc. must reach the Honorary Director, **Population Research Centre** at above address within two weeks of publication of this advertisement.

imposition of a certain communal identity.

Thinking about women's resistance to repatriation leads me to consider general tensions in oral history research to 'abduct' a woman's identity for our own scholarly purposes, even when we are trying to write against the state's coercive projects. How do women now respond to scholarly inquiries about rape, forcible coversion and repatriation? Within even the most sensitive and critical scholarship, there are echoes of women resisting being appropriated as symbols of identity in contemporary research. Menon and Bhasin (1993) offer evidence given by an informant who they call 'S'. S was returned to India against her will, and remained in an ashram all her life, where she taught school and eventually became the headmistress. Menon and Bhasin quote a little bit from her testimony about being kidnapped. "Leave it. What use is it recalling the past? Forget about it, I've banished it all from my mind. I lead a respectable life now, why look back to the past – even my children don't know anything about it. Nothing can be done it now. It can't be resolved".

Survivors of rape and other kinds of partition violence often by necessity live lives filled with silence. A woman kidnapped from her parent's or husband's home and raped may fear that she will not be accepted by society if she 'goes back'. For the raped and abducted woman, then, there were no neutral spaces left to turn. Many women kidnapped during the partition became incorporated into the families of their attackers through marriage and became respected wives and mothers. There were a whole range of uncertainties for women about leaving their present situations, where they often eventually attained a certain degree of security and respect. What could lie in store for them on the other side? Do women now want to sever themselves from their families by revealing to scholars that their husbands, brother-in-laws, or neighbours had originally abducted and raped them? Or do they want to talk about being raped by others and then forcibly repatriated. The question of loyalty to both family and nation is a potentially very troubling one when we are asking women to tell us what happened. The rape may have been 40 or 50 years ago, but the question of self-identity can never be resolved or completed. Where does an abducted woman really belong?

I am not advocating a return to the constitutionally-based histories that describe the events of partition as high politics rather than personal experience. The history of rape and abduction is going to be written. Yet I think we need to consider what a project of collecting oral history means both for ourselves and for the women we might interview. Why was 'S' so unwilling to speak? Why has there been such an incredible silence about sexual violence for over 40 years? By encouraging women survivors of partition to tell us their stories, in some crude sense we may be kidnapping them again.

If we can criticise the state for forcibly repatriating women to the other side of the border, we need to reflect upon our efforts to pull women informants back across our own borders and notions of identity. Even in the process of identifying potential informants, we are already beginning to set certain women apart as having ruptured or 'fractured' self and communal identities. We are then appropriating their supposedly 'flawed' identities in our own projects of saying what partition means. Clearly some of my concerns here have to do with more generic issues of consent and power between interviewer and interviewee. As we have seen, a woman can refuse to speak. Yet it strikes me when asking women to speak about their conditions of location and dislocation, we may be reinscribing and fixing our own notions of community and border. What kind of identities are we assuming when asking women to reiterate the stories of their 'true' origins? Basically, is a woman's identity the same as her childhood family or her husband's family? Are our own reified conceptions of 'identity' and 'community' being mapped when we ask women what side of the border they 'really' belong? These questions about the continuing sensitivities of identity suggest that the partition did not stop in 1947 when the national borders were drawn, and may always necessarily remain incomplete. Perhaps the overwhelming silence on issues of rape and recovery for so many years should stand as a reminder that the consequences of talk may be too great for us to even imagine.

A Fragment of History

Though I have by no means exhausted the possibilities and perils of oral testimony, at this point I would like to look at questions of identity and women's agency in the case of an unconventional written document to seek further 'witness' on how communities dealt with the experience of rape, abduction, and unwanted pregnancy. In a conservative newspaper called *Hindu Outlook*, for example, a curious advertisement ran for three months in nearly every issue from April 1 to July 8, 1947. This advertisement was for a drug called 'Vandya Karak', which can be roughly translated as 'steriliser'. The following is the text of the ad:

No Conception Will Occur

If on account of any disease, weakness or otherwise any woman does not wish to give birth to children, she should use our well known medicine 'Vandya Karak' for five days only. It will stop conception for the future, without interference in the wordly enjoyment in any way. Thousands of women have been benefited by this medicine. It is not harmful to them in any way. Price Rs 4; Postage Ans 12.

Stopped Menses

This medicine brings forth and regulates the stopped and irregular menses (monthly course) of women – whatsoever the cause might have been. Please note that no pregnant woman should use it, otherwise abortion shall occur. Price Rs 7, Postage Ans 12. Address: Chapla Devi, Dwakhana Chapla Bhawan, No 15, Muttra.

I would like to put forward this advertisement as a piece of evidence to this period of large-scale sexual violence. The last line of the advertisement, "please note that no pregnant woman should use it, otherwise abortion shall occur" could be read as a direct call for the needs of a woman with an unwanted pregnancy. I should point out as an aside that clearly there has been unwanted pregnancy in south Asia outside the context of communal rape as well, and from the advertisement we cannot be sure that this advertisement was intended for rape victims. Yet the period of time that the advertisement ran, from April to July 1947, coincided with the period just before the constitutional partition, dovetailing with incredible tension about the placement of territorial boundaries. In the context of widespread tensions about the abduction of women, advertisement for this drug presents a solution to pregnancy resulting from communal rape. For readers of English newspapers during this time, who might have otherwise had the means to go to a clinic or hospital, this advertisement is also one sign that the community has established its own quiet methods of dealing with the tensions over women's pregnancy and perceived violation of community borders. Other types of treatment must have been known about through word of mouth.

Abortion was clearly one of the solutions to the recovery of the moral standing of the community, symbolically violated through real violence done to women. Advertisements of this type reflect Veena Das' theory about the changes in meaning that reproduction and child-bearing took on during partition and the politicisation of identity groups. Das asks, "What happens when women are impregnated by other men and give birth to 'wrong' children?" [Das 1990:2]. As Das proposes, we need to situate motherhood as posing a problem for women's communal identity and the conditions of possibility for her re-absorption into the nation. The Abducted Persons Bill did not recognise marriages which had begun in adbuction. Chidren born of such unions were considered illegitimate, so motherhood to a child in these circumstances marked women as outsiders. Medicines like Vandhya Karak were quite ways of privately 'fixing' the problem of unwanted pregnancy and helped

create and control communal boundaries. This one advertisement presents potential evidence of resources available in the community to homogenise and 'clean' a religious community, dovetailing with state policy. Just as some women became quietly incorporated into their attackers' families and built homes and lives of respect, communities have their own quiet and potentially coercive ways of retaining integrity in traumatic situations. Yet plenty of questions remain. We know little about how this drug was used and by whose choice. Should we take this drug to be a sign of benevolence or coercion?

The history of rape and abduction is being written. Yet we must recognise that we are now gathering evidence and writing the history of partition in a very specific historical moment of communal problems, and think about how our production of history inscribes contemporary problems into yesterday's memories. We need to be attentive to how we access women's stories and think about how their words may be linked to contemporary pressures to speak about communal identity in particular ways. I would also like to reiterate that for the thousands of women who survived the rapes of partition, our soliciting of 'witnesses' and 'survivors' would potentially mean asking them to invalidate their present status, a process of 'informing' on the actions of their husbands and their families in a way that would be both alienating and potentially self-destructive. We need to think about how collecting stories about the partition may negate the lives of respect that these women have managed to construct out of their experiences of intense trauma. Who are we writing this history for? Our belief that 'just talking things out' with our informants and collecting testimonies of witness may not be helpful to survivors of violence. For many women, questions of identity do not go away at the end of the interview. Do women constitute themselves as 'victims' before or after our interviews?

A Ganesh Kumar

This note summarises the results of a recently completed study which examined the impacts of trade liberalisation, agricultural input subsidy reductions and safety net programmes for India with an applied general equilibrium model with nine agricultural sectors, one non-tradeable non-agriculture sector and one tradeable non-agriculture sector and with five rural and five urban income classes. The study demonstrates the importance of accounting for large country effects in rice trade and estimates the optimal tariff/quota for rice exports for India – which is found to be just half a million tonnes of net export of rice. The results show that non-agricultural trade liberalisation is even more important for agriculture than even agricultural trade liberalisation, both of which help accelerate growth. The study concludes that a policy package involving trade liberalisation with moderate residual taiff as permitted under GATT and agricultural inputs subsidies removal accompanied by targeted safety net programmes along with stepped up investment in irrigation, with the expected additional foreign inflows materialising, produces a scenario that is superior from the point of growth, welfare and distribution and that this can be financed without raising taxes

I
Introduction and Issues

THE Indian economy has not grown rapidly in the past in a command and control type of environment that offered little incentive for efficient use of resources. The economic reforms initiated in June 1991 aimed at putting the economy on a high growth path through improvements in efficiency in the industrial sector by bringing in competition.

Unlike industries, agriculture has functioned more or less in a competitive environment all along. Nevertheless, inefficiencies in resource use in agriculture arose due to trade restrictions, inappropriate pricing of inputs and outputs, and the prevailing macro-environment. Trade restrictions take various forms like, total ban on exports, export licensing/ceilings, canalisation through governmental agencies, as well as restrictions on export prices. Distortions in input prices arise mainly due to subsidies on farm inputs such as fertiliser, irrigation, power and credit. A combination of the trade restrictions and government intervention in commodity markets result in distortions in farm output prices. It is time that the reforms address to these inefficiencies in agriculture so that gains from industrial reforms are enhanced further.

This note summarises a study that examines a number of issues that arise in the context of agricultural liberalisation. The study addresses the following specific questions.

(1) Should agricultural trade be liberalised? If yes, should we liberalise all commodities or only selected ones? In particular should we liberalise rice trade as its global market is thin?
(2) What would be the impact of liberalisation on the growth of the economy, sectoral outputs, trade and prices?
(3) How would it affect welfare of different expenditure classes in both rural and urban areas?
(4) What would be the impact of removal of subsidies on agricultural inputs?
(5) How to offset welfare loss, if any? What would be the net impact of liberalisation and such offsetting measures?

The study adopts the normal small country assumption for most of Indian agricultural produce. But the case of rice appears to be different. India is a major producer of rice. The buffer stock of rice with the government (18 million tonnes in January 1995) is itself more than the world trade volume of this commodity. Given such market power there is a need to study the large country effects while considering the trade liberalisation of rice. In particular one may look into the question of adopting a socially optimal tariffs/ export quota policy.

II
Methodology

Agricultural reform is likely to affect almost everyone. Trade liberalisation would affect domestic prices of different commodities differently. Changes in relative prices would cause farmers to change their cropping pattern and allocation of inputs such as fertiliser to different crops. This will result in changes in output levels and farm incomes. The trade pattern will also change. Changes in relative prices also affect consumers and their welfare. All these would have implication for government's tax revenues and expenditures for subsidies and anti-poverty programmes. The macro-economic consequences for the economy can be significant.

Thus to answer the questions posed above satisfactorily, we need to account for all these interdependencies and feedbacks. We have done this through policy simulation using an applied general equilibrium (AGE) model.

We use the Agriculture, Growth and Redistribution of Incomes Model (AGRIM) of Narayana, Parikh and Srinivasan (1990). This is a sequential general equilibrium model that computes equilibrium price and output for each year in succession. Many of the supply and demand relations in the model have been econometrically estimated. It considers nine agricultural sectors and one composite non-agricultural sector. There are three sets of agents: producers, consumers (classified into five expenditure groups in each of rural and urban areas), and government. Producer behaviour determines commodity supplies and incomes Consumer behaviour generates commodity demands and household savings. The government sets policies such as investment targets, taxes, tariffs, quotas, rations, price supports and ceilings. Finally, equilibrium is achieved through exchange in which domestic demands, together with export demand by the rest of the world for each sector's output, is equated to the sum of domestic supply (emerging from previous year's production net of changes in stocks) and imports.

The base/reference run is a business-as-usual scenario in which past policy regimes continue. Any policy changes relative to the reference scenario have been introduced beginning 1993 and their impacts studied over the period 1993-2000. Comparison of the outcomes of the reference run and the policy scenario for the indicators reflecting the various objectives of the society show the impact of the policy change.

In the reference run, it is assumed that the policies with respect to procurement and public distribution of foodgrains, public consumption and investment, foreign trade and aid, etc, would correspond to those prevalent in the recent past. Trade quotas on different agricultural commodities range from 5 per cent to 15 per cent of domestic supplies. For rice, an export quota of half

a million tonne is imposed to reflect the thinness of the world market. Domestic price policy sets target prices in a way that provides the estimated degree of protection to that particular commodity.

An important assumption in the reference scenario and most policy scenarios is that total (= public + private) investment follows a specified investment-GDP relationship. This is accomplished by requiring that government savings adjust through adjustment of tax rate to supplement private savings. This requirement is relaxed in some scenarios where tax rate is kept fixed and public investment adjusts.

Free trade implies removal of all price distortions including trade quotas. The model captures this by removing the prevailing protection/disprotection for the different sectors. Thus, domestic consumer price for an exported (imported) commodity is set as world market price minus (plus) international trade and transport margins in the policy scenarios. The prevailing protection rates used in the model are: wheat –0.12, rice –0.34, coarse grains 0.10, bovine and ovine meat –0.15, dairy products –0.15, other animal products –0.15, protein feed -0.30, other foods 0.40, non-food agriculture -0.10, tradeable non-agriculture 0.35. The protection rates for the agricultural sectors are based on Gulati et al (1993). These protection rates are derived by comparing existing world market price with domestic price. Ideally, one should estimate it by comparing domestic price with what the world market price would be when India removes its protection. For a small country these two estimates should not be very different. While in the reference scenario these (dis)protection rates are used, in the trade liberalisation scenarios these rates are set to zero and trade quotas are removed. An exception is rice for which an export quota is imposed to reflect the limitation of the world market to absorb it (as discussed below).

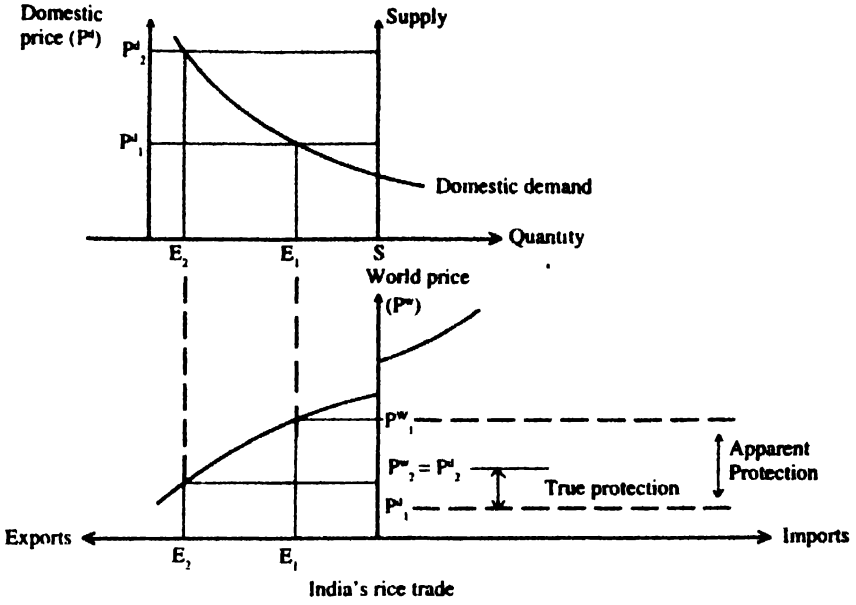
III
Results and Conclusions

Various policy scenarios have been developed to analyse the impact of trade liberalisation, optimal rice export quotas/tariffs, retaining moderate protective tariffs, capital inflows, agricultural inputs subsidy removal and safety net programmes. The main conclusions emerging from the study are summarised below.

Trade Liberalisation: Does It Help Economic Growth?

Trade liberalisation helps to accelerate economic growth in the medium run by increasing allocative efficiency within agricultural sectors and between agriculture and non-agriculture, and by increasing real investment due to terms of trade effects. In fact, in seven years after liberalisation in 2000, the GDP is larger by 4.5 per cent and agricultural GDP larger by 4.1 per cent compared to the reference scenario.

The impact of increase in investment is much stronger than that of increases in allocative efficiency. However, it should be noted that potential gains due to better allocative efficiency within non-agricultural sector as also within some of the commodity groups (e g, Other food sector) are not captured in the model in its present form. Subject to these limitations, this implies that investment goods liberalisation has a greater impact on growth, even agricultural growth, than agricultural liberalisation. Agricultural trade liberalisation beginning 1994 results in a growth of 1 per cent by the year 2000 in agricultural GDP, whereas when non-agricultural sector is also liberalised, agricultural GDP grows by more than 3 per cent. The terms of trade moves in favour of agriculture by 27 per cent when non-agriculture is liberalised whereas it is less than 2 per cent when only agriculture is liberalised. The terms of trade effects dominate the scenario outcomes. Thus, a very important conclusion emerges. Non-agricultural trade liberalisation is even more important for Indian agriculture than agricultural trade liberalisation. This also means that the process of liberalisation which has so far only reduced non-agricultural protection cannot be said to have bypassed agriculture.



In the long run, agricultural liberalisation increases output of all agricultural commodities excepting coarse grains and 'other foods' (which includes sugar, oils, etc), the sectors for which our estimates of the nominal protection rates were positive. However, when non-agriculture is also liberalised, the outputs of these two sectors also increase. In the short run, however, agricultural trade liberalisation by itself disrupts agricultural production, mainly in the 'other foods' sector by as much as 8 per cent. But if non-agricultural trade is liberalised agricultural output, including that of 'other foods', picks immediately by about 4 per cent by 1995. The short run growth effect of trade liberalisation on non-agricultural output is weak due to prevailing capacity constraint, leading a big jump in non-agricultural imports. Over time, as capacity is created non-agricultural output expands and imports stabilise.

In the long run, liberalisation leads to higher volume of exports of all agricultural goods, except coarse grains. Particularly, exports of wheat, rice, dairy products and non-food products could expand substantially. Prices of several agricultural sectors, which are disprotected now, would rise with trade liberalisation, while prices of industry and some agricultural sectors (coarse grain and other foods), which are protected now, would fall. The only exception to this pattern is the case of rice the price of which falls despite prevailing disprotection. This counter-intuitive result is explained through the large country effects and associated export quotas, as discussed later.

How Does Agricultural Trade Liberalisation Affect Welfare?

The average welfare indicators such as average calorie intake, average equivalent income and rural-urban income parity show improvement under agricultural trade liberalisation. This is because the welfare effects of trade liberalisation differs across different expenditure classes in the rural and urban areas. Agricultural liberalisation by itself improves the welfare of the poor in both rural and urban areas. The marginal increase in terms of trade for agriculture and the decline in prices of rice, coarse grains and other food together result in different impacts on consumer price indices for different expenditure classes. The adverse income effect associated with the increase in terms of trade is more than adequately compensated by the gains to the poor as consumers due to fall in rice, coarse grains and other food prices. The rural rich who

Figure : India's Rice Trade, World Price and Protection Level

India's rice trade

get income from both agriculture and non-agriculture are, however, worse off due to liberalisation in terms of their equivalent income. This is because, as government loses tariff revenue due to liberalisation it has to raise taxes, which are stipulated to be only on non-agricultural income. Therein lies the dilemma of agricultural trade liberalisation. The rich farmers would oppose it even though the rural poor and urban population stand to gain from it.

Non-agricultural trade liberalisation results in a deterioration in the average welfare indicators. This is largely due to the fall in equivalent income of the rural rich and whole of urban population due to increase in tax rates on non-agricultural incomes. The equivalent incomes of urban population falls in spite of growth in real non-agricultural GDP because of the terms of trade effects.

Large Country Effects: What Is the Optimal Tariff on India's Rice Exports?

Taking into consideration the large country effects in the case of rice as discussed earlier, the study concludes that if India were to export rice freely, the world market price of rice is likely to fall. When we consider such effects, rice sector is not disprotected to the extent implied by the present world prices. In commodities where India has market power, the non-linearity in world prices in response to India's trade of the commodity should be accounted for. A correct measure of disprotection of rice would be the difference between present domestic price and the world market price that would prevail if India were to have free trade in rice. The Figure shows this correct measure of (dis)protection.

The top part of the figure shows domestic demand curve. Given a fixed supply (the argument is valid even if supply is made to respond to price) the export level will vary with domestic price. Thus at price P^d_1, the export will be SE_1 and at P^d_2 it will be SE_2. In the bottom part of the figure is shown the world market price's response to India's rice trade. At an export level of SE_1 world price would be P^w_1 and at a level of SE_2 it would be P^w_2.

In a situation where a domestic price of P^d_1 prevails an apparent estimate of nominal protection rate would be $(P^w_1 - P^d_1)/P^w_1$. Now suppose under no export restriction the domestic price is P^d_2, exports SE, and world market price $P^w_2 = P^d_2$. The 'true' nominal protection rate is now estimated to be $(P^w_2 - P^d_1)/P^w_2$.

Given its market power in world rice trade, India could think of imposing tariff on rice exports. To determine the level of optimal tariff, we need to analyse the impact of Indias exports on world market price of rice, which is a major task in itself. Based on estimates made by Parikh et al (1987) and suggestions of the World Bank, we used a rice demand elasticity of 0.1 and a supply elasticity of 0.4 for the rest of the world to determine the world market price that would prevail corresponding to different quotas on rice export varying between 0.5 and 4.0 million tonnes by India. For exports beyond 4 million tonnes, the world price falls below the domestic price and the run would be inconsistent in the sense that we force the model to export rice when we should be in fact importing.

The results of this exercise indicates that as rice exports rise, domestic rice price increases. The production structure shifts in favour of both rice and wheat and there is a gain in real GDP. For optimal tariff policy, however, we should go beyond the GDP effects. We consider welfare level in terms of equivalent income of different classes. Equivalent income is defined as the income required to provide a consumer at a reference set of prices the same utility as provided by consumption in policy change scenario. Thus, we can compare equivalent incomes in different scenarios. To compare distributions of equivalent incomes across different groups we use the Willig-Bailey (1981) criteria which compares average equivalent incomes of different cumulative population proportions for rural and urban areas and looks for stochastic dominance. These indicate that the export tariff for rice would be socially optimal at a level such that rice exports are around half a million tonne.

Should We Retain Protective Tariffs?

Retaining (imposition) of moderate protective tariffs as permissible under GATT reduces the GDP gains and welfare impacts arising from trade liberalisation. If protective tariffs are maintained at 25 per cent *ad valorem* on non-agricultural trade, GDP in year 2000 would be lower by about 0.8 per cent than under trade liberalisation with no protective tariffs. This suggests that these tariffs should be imposed only after careful consideration of benefits and costs. It may be noted that our model does not account for potential benefits (if any), of dynamic improvement in efficiency due to (infant industry) protection. In any case, a case for protection has to be made before it is granted. This should be particularly so for capital goods sectors because of the real investment benefits from trade liberalisation noted earlier.

What Would be the Impact of Capital Inflows?

If liberalisation results in additional inflow of foreign capital which is used for increasing investment then it helps in both accelerating growth and reducing adverse welfare effects. If the capital inflows rise from 1.5 per cent in 1993 (base scenario) to about 4 per cent by 1996 and maintained thereafter, GDP in year 2000 would be higher by 2.6 per cent over and above the improvements due to trade liberalisation.

Agricultural Input Subsidies Removal, Increased Investments and Safety Net Programmes: Is There a Pareto-Superior Win-Win Policy Package?

Removal of input subsidies is often advocated as a part of the reforms measures required to eliminate the distortions in agricultural prices. Removal of agricultural input subsidies, with other government expenditures being constant, would result in the release of substantial amounts of resources. These resources can be used in several alternative ways such as for tax reliefs, for enhancing investments and/or for welfare programmes.

If the savings from subsidy removal, along with trade liberalisation, are used merely to provide tax reliefs, it results in a loss in GDP by about 1.5 per cent in the year 2000 with agricultural GDP falling by about 3.5 per cent. This aggravates rural poverty though the rural rich and urban population gain from tax reliefs. However, when such savings are used for increasing investment, especially irrigation investment, the adverse effects on growth and distribution are more than offset resulting in higher growth of about 1.3 per cent. There is virtually no loss in agricultural GDP and distribution is also more equitable. Thus the conclusion that emerges is that, if agriculture is to be subsidised it is better to subsidise investment in irrigation rather than use of current inputs.

Expansion of safety net programmes such as targeted rationing or public works programmes (like the Employment Guarantee Scheme (EGS) or Jawahar Rozgar Yojana (JRY)) when financed through savings from agricultural input subsidy removal can fully protect the poor from adverse welfare effects of trade liberalisation and input subsidy removal. In fact, such measures can substantially improve their welfare over and above even the base scenario which reflects the pre-liberalisation policies.

Thus a policy package involving trade liberalisation with moderate residual tariff as per GATT and agricultural inputs subsidies removal accompanied by targeted safety net programmes along with stepped up investment in irrigation, with the expected additional foreign inflows materialising, produces a scenario that is superior from the point of growth, welfare and distribution and this can be financed without raising taxes.

Subsidy Syndrome in Indian Agriculture

Ashok Gulati
Anil Sharma

The economy-wide analysis of input subsidies in Indian agriculture reveals that subsidies have outlived their aim and have become unsustainable. In order to release resources for higher investments in the agricultural sector, large-scale price and institutional reforms are needed to relieve the pressure of subsidies on the Exchequer. Under the circumstances, it makes much sense to improve terms of trade for agricultre and complement this by stepping up investment in agriculture through reduction in subsidies. The increased investment in agriculture appears to be a better bargain than short-sighted measures such as subsidies. This is because of the fact that cultivable land in India is in short supply and raising productivity per unit of cultivable area will require heavy investments in irrigation, rural infrastructure, research and extension. Also, investments in basic infrastructure correct for regional imbalances and promote greater equity at farm level, while subsidies tend to accentuate inequality.

OF late, the issue of subsidies in general and agricultural subsidies in particular, has assumed considerable significance. This has happened essentially because of two reasons. Firstly, the rising burden of revenue deficit had created fiscal imbalance in the central and state budgets during the late 1980s. Neglect of simple economic principles in various sectors of the economy contributed their due and the growth process increasingly relied on unsustainable financial foundation. The burgeoning burden of these subsidies was thus, questioned by policy-makers trying to correct fiscal imabalance. Secondly, this issue of agricultural subsidies was brought to the centre stage under the Uruguay round at GATT negotiations In India, this created lot of confusion, especially in the initial year of Uruguay round, whether Indian agriculture is really net subsidised or taxed, i e, aggregate measure of support (AMS) is positive or negative.

These two developments, along with our own concern pertaining to plausible impact of subsidies on efficiency in resource use and environmental degradation in general, induced us to examine the issue of agricultural subsidies from various angles. An effort, therefore, has been made to analyse agricultural subsidies with respect to their rationale, magnitude and their economy-wide impact.

The paper is organised as follows: Section I examines the rationale of subsidising agriculture. Section II analyses the issue whether Indian agriculture is net subsidised or net taxed. Section III discusses the issue whether subsidies be increased/abolished/targeted, particularly in a developing country like India. Section IV spells out various concepts of input subsidies, how to quantify them and what is the magnitude of input subsidies in Indian agriculture. Section V examines the economy-wide impact of input subsidies, i e, fiscal impact, cropping pattern impact, environmental impact, equity impact and impact on new industries. Finally, Section VI discusses the price and institutional reforms that are desirable in the area of input subsidies.

I
Rationale of Subsidising Agriculture

The subsidies in agriculture are generally rationalised in the overall economic context that they play a crucial role in stimulating development of any country through increased agricultural production, employment and investment. Also that subsidies, particularly in developing countries must be construed as more an instrument promoting risk-taking function of the farmers than anything else. More specifically, subsidies are advanced either to promote the use of new inputs or to transfer income in favour of farming community, maybe to keep them in 'parity' with non-farming communities. The use of subsidies to promote new inputs is generally the case with developing countries and transferring the income in favour of farming community is the case with developed countries. But, before we go on to discuss these issues, let us explore various alternatives which are available with the policy-makers for subsidising agriculture.

There are two most common ways of subsidising agriculture.[1] Firstly, governments may pay much higher prices for the agricultural products than what the farmers can obtain under free market environment, and secondly, by supplying the inputs at a price that is below the cost of supplying these especially in case of non-tradable inputs or below the price that would prevail in an open free trade environment (as in case of tradable inputs). Higher prices for farm products can be provided mainly by insulating the domestic markets from the world economy through a restrictive trade policy. On the other hand, vital inputs like fertilisers, irrigation water, credit, electricity used in the agricultural sector can be supplied to the farmers at prices which are below their would be open market prices. The prices of these inputs, therefore, do not reflect their true value, i e, the real cost of supplying these inputs. Of the above mentioned two alternatives, subsidies on inputs are normally preferred because it is believed that benefits of government expenditure can be derived by the farmers only in proportion to their use of inputs [Krishna 1967]. Input subsidisation also avoids raising food and raw material prices, thus avoiding the plausible adverse effect on growing industrial sector or large mass of poor living in the developing countries. However, most often, it is not just a single mechanism but a combination of both higher output prices and lower input prices which has been used to subsidise agriculture with objectives varying from the need to raise domestic production and protect incomes of the farming community. India also tinkered with both input and output prices, primarily to protect the poor and/or to stimulate the use of modern inputs.

II
Is Indian Agriculture Net Subsidised?

As mentioned above, India adopted the twin approach of input subsidisation and output price for her agriculture. To know the impact of such a complex and dual policy (i e, input subsidies and output price support) in India, one will have to work out the estimate of what is known as aggregate measure of support (AMS). AMS is the annual aggregate value of market price support, non-exempt direct payments and any other subsidy not exempted from the reduction commitment expressed in monetary terms. Thus, to estimate AMS for Indian agriculture, first one works out the level of support for each basic product (like rice, wheat, cotton and so on) that it obtains through (a) market price support, (b) non-exempt direct payments, and (c) other subsidies not exempted from reduction commitments. Support which falls under the purview of non-product specific (like various input subsidies) is totalled into one non-specific AMS expressed in monetary terms. In the product specific AMS, the market price support is calculated using the gap between a fixed external reference price (fob unit value in a net exporting country and cif value in a net importing country) and

administered price (domestic support price) multiplied by quantity eligible to receive the administered price. In the non-product specific input subsidies are determined by using budgetary outlays. However, if budgetary outlays do not reflect the full extent of subsidy, the subsidy is worked out by using the gap between the subsidised price of the inputs and a representative market price multiplied by the quantity used of inputs.

The estimates based on support prices reveal that product-specific AMS for India (for 17 products out of 22 total products for which India maintains market price support programmes) works out to be negative to the tune of (–) Rs 242 billion during the period 1986-87 to 1988-89. This forms (–) 27.74 per cent of total value of agricultural production (excluding forestry and fishery).[2] Non-product specific AMS works out to be Rs 46 billion, 5.24 per cent of total value of agricultural production. This, of course, would vary depending upon the way one measures subsidies, particularly irrigation subsidy. By adding these two one gets total AMS which stands at (–) Rs 196 billion, that forms (–) 22.50 per cent of the value of agricultural production. In fact, over the years, the AMS has increased in negative and stood at (–) Rs 341.44 billion during triennium ending 1992-93. This massive increase of 73.77 per cent in absolute value of AMS seems to be the effect of depreciation of rupee against major currencies of the world during this period as also in relative prices of different commodities. This negative support (or net taxation) is due to the fact that prices of different crops have been fixed below their international levels (barring exceptions like oilseeds and sugarcane). The calculations of taxation at farm harvest prices are also in line with those obtained on the basis of support prices, however, the degree of taxation differs. These facts clearly indicate that Indian agriculture is 'net taxed'.

These trends of domestic support are contrary to those found in the developed countries of the world [Gulati and Sharma 1994b]. Almost all countries provide positive support to their cultivators ranging from as high as 72 per cent in case of Japan, 37 per cent in case of European Community and 26 per cent in case of the US.[3] This is in sharp contrast to India which imposes tax on its cultivators.

This policy of keeping farm prices below their international prices, however, contributed to the bias against agriculture. The agricultural product prices were kept low presumably to protect the poor, but industrial prices were kept high by erecting high tariff barriers.[4] The lower prices of agricultural output have not been offset by the subsidies on inputs. The terms of trade remained much against agriculture due to government policies compared to what they would have been in a free trade environment. In addition to the low output prices, the pervasive government intervention in terms of movement restrictions, distributional controls, stocking, domestic and foreign trade, though initially designed to improve the welfare of the people, have injected inefficiencies in the entire agricultural system [Bhagwati and Srinivasan 1993]. This diverted resources away from agriculture to industry. Investment in agriculture remained stagnant during the 1980s (Figure 1).[5] This is in sharp contrast to the trends observed in investment during the 1960s and 1970s. This happened despite the fact that gross domestic capital formation increased during the 1980s. This is explained in Section V.

III
Should Subsidies Be Increased/ Abolished/Targeted?

Analysis in the previous section reveals that Indian agriculture is not net subsidised but is rather net taxed. If so, does that mean that subsidies to Indian agriculture be increased? And how — through higher output prices than what would prevail under a free open economy environment or through enhanced subsidisation of inputs? Answers to these hard questions, in our humble opinion is 'no'.[6] To justify our position with respect to subsidies, the following issues need to be explored and replied:

(i) Are subsidies the best way to achieve the intended objectives of growth, employment and investment?

(ii) If yes, then for how long the subsidies should be continued to meet the above mentioned objectives?

(iii) What is the overall long-term cost of these subsidies to the entire economy? and,

(iv) Are subsidies promoting regional equity and allocative efficiency at the national level?

These are the basic questions which should be taken into account and need to be answered before advancing a case for 'net' subsidies. Also, costs of input subsidies have to be evaluated against the loss of potential benefit if the same amount was invested in creating productive potential of agriculture. It is argued that incentives like subsidies are short-term measures [Krishna 1967] and they are not meant to be substitutes for the long-term measures in social and physical infrastructure, which alone ensures the viability of the new technology [Hayami et al 1977]. Even in the short-term a sharp rise in subsidies may cut into the resources available for productive investments and this is what seems to have happened in the Indian context.[7] Our assessment of the current situation leads us to conclude that input subsidies are cutting into the resources which could have been invested in generating new productive potentials. This is because in a country like India where resources are limited, the achievement of any particular objective usually comes at the expense of other competing objective. Thus, it follows from the above that a major chunk of the increase in resource flows is being diverted to meet the expenditure originating from high input subsidies rather than making investments in agriculture. This trend, if continues, is worrisome because if the resources which are meant to create productive investments in the long term are diverted to meet short-term measures like subsidies, the agricultural growth suffers.[8] And, history is replete with examples which clearly reveal that development of agricultural sector is essential to national growth.[9] This is due to the fact that agricultural sector plays a vital role in the economy of a developing country like India due to its large share in gross domestic product, and more so in employment, and also because of strong linkages that this sector has with the rest of the economy.

Subsidies on inputs are generally advanced on the assumption that these are temporary measures and would be withdrawn once the objectives have been achieved. But past

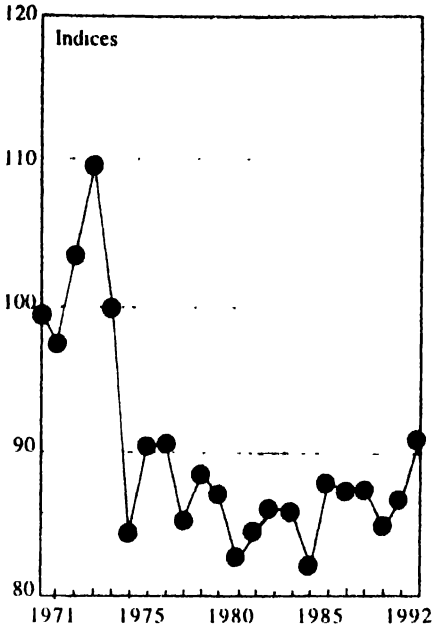
Source: Gulati and Sharma (1994a).

experience clearly shows that it becomes increasingly difficult to reduce or abandon subsidies. In fact, there is nothing wrong with subsidies if they are well-targeted and reach the intended beneficiaries and have a definite time frame for their termination. But, there is ample evidence to suggest that the major share of these subsidies has been appropriated by fewer well developed regions and better-off sections of the farming community [Subbarao 1985] and they have spilled beyond their original schedules. Another problem associated with input subsidies is that they distort the choice of commodities and choice of techniques for each commodity [Binswanger 1974]. They lead to inefficient choice of cropping patterns and there are indications that inputs are being overused in certain pockets of the country.

The subsidies on inputs are efficient only in the initial stages of their adoption but once the farmers become aware of the inputs, there is no need to subsidise. If continued for a long time they create pressure groups and lobby which calls for continued protection and it becomes difficult to remove or reduce the subsidies [Dalrymple 1982]. The experience world over shows that continued subsidies for a long time lead to distortions in the economy, require cross-subsidies, result in inefficient use of scarce resources, become difficult to manage and execute and finally it becomes difficult to discontinue such incentives. All these apprehensions regarding input subsidies expressed in Meier (1982) have come true.

Keeping these facts in view, the objective of this paper is to measure the extent or the magnitude of subsidies on four major inputs in Indian agriculture, viz, irrigation water, electricity, fertiliser and credit. Once these estimates are available to the policy-makers, appropriate policies can be devised to cut down the size of input subsidies so that long-term growth in agriculture is not jeopardised. An attempt has also been in the present study to suggest ways to reduce or to check the ever rising input subsidies.



IV
Input Subsidies — Concepts and Quantification[10]

Concepts and Methodology

Considering the fact that there are implicit and explicit input subsidies in Indian agriculture, the question arises how to estimate these subsidies. Subsidies could be worked out from the farmer's point of view, from the view point of the input supplying agencies and from the society's point of view. The estimates of subsidy will differ in each of these cases because of differences in the procedures adopted.

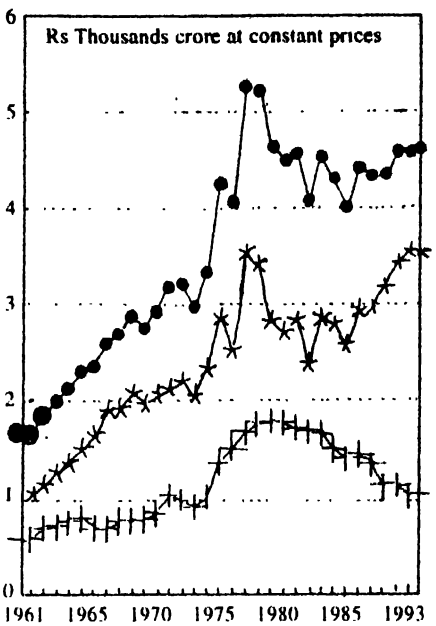


FIGURE 1

Terms of Trade (Ratio of Prices Received and Prices Paid by the Farmers)

Source Sidhu (1993)

Gross Capital Formation in Agriculture Proper (1960-61 to 1992-93)

Source CSO (1994)

(i) From the viewpoint of the farmer who is a user of inputs the subsidy could be defined as the difference between what he is willing to pay for it and what he is actually paying. In this case the maximum that a farmer would be willing to pay would be equal to the marginal value product of input use. This concept of subsidy is akin to consumer's surplus in economic theory.

(ii) From the viewpoint of input supplying agencies, the subsidy could be defined as the difference between the cost of supplying these inputs and revenue received from the farmers. This concept helps in knowing the profits or losses incurred by the supplying agencies in supplying these inputs/resources

(iii) From the society's viewpoint subsidy could be defined as the difference between true resource cost of supplying inputs measured at shadow prices and what the farmers pay for it.

In the present study the subsidies have been worked out from the viewpoint of suppliers of inputs such as water, electricity, fertiliser and credit, who help to get supplies of these inputs. Thus subsidy may be defined as the difference between the cost of supplying a particular input and the recoveries from supplies. This, however, needs a number of adjustments keeping in view the data limitations. Various components of input subsidies in Indian agriculture are described below.

(i) *Irrigation Subsidy*: It can be estimated under two alternative definitions:

(a) Estimate I — As the difference between O and M expenses and the recoveries from farmers: The underlying logic of this is that of marginal cost pricing principle for welfare maximisation, which states that pricing of a resource should be done on the basis of its marginal cost, one may think of charging only the operation and maintenance costs from the farmers. This means that irrigation works are subsidised to the extent of the difference between gross receipts and the operation and maintenance expenses incurred by project authorities.

(b) Estimate II — Subsidy on Working Expenses and Capital Outlay: The approach mentioned above estimating subsidy by deducting receipts from working expenses takes care of the operation and maintenance expenses only and leaves the entire capital cost out of its purview. This implicitly means that capital cost of various irrigation schemes should be treated as sunk But it would be preposterous to treat this capital as sunk, because money invested in various irrigation schemes has its opportunity cost which must be considered along with operation and maintenance costs One way to determine the opportunity cost of this investment would be to look at the annualised yield of capital.[11] This calls for finding out an appropriate rate of interest, and also a rate of depreciation for major and medium and minor irrigation schemes. Thus, the rate of interest (average redemption yield of government securities) was taken as 8.5 per cent which is an average redemption yield on government bonds as well as approximate cost of borrowing funds by the government And, the rates of depreciation were taken as 1 5 per cent in case of major and medium irrigation schemes

and 4 per cent in case of minor irrigation schemes to estimate the annualised cost of capital employed in irrigation works.[12]

(ii) *Electricity Subsidy:* Subsidy on electricity could be determined in two different ways. One way out is to work out the difference between the tariff charged from the agricultural sector and the shadow price of the electricity which goes towards irrigation purposes. The difficulty which arises here is to find the shadow price of electricity. Shadow price can be determined by approximating opportunity cost of the electricity consumed in minor irrigation. But the question which crops up here is: what alternative user should be considered for shadow pricing, i e, commercial, industrial or domestic. This too will not reflect the true shadow price because the tariff structure for these sectors also is distorted compared to their costs. The second method could be to find the opportunity cost of resources which are used in the generation and distribution of electricity. Tradable inputs may be computed at their corresponding cif/fob prices (depending upon whether they are importables or exportables) and non-tradables at their shadow prices. This is a much bigger task and is not attempted in this study. The alternative adopted here to estimate subsidy, however, is by taking the difference between the average cost of supplying electricity to various sectors and the tariff charged from agricultural sector and multiply this difference with the quantum of electricity used in agriculture.

(iii) Fertiliser Subsidy: Fertiliser subsidy could be estimated under the assumption that if government had not intervened in the system either through retention price scheme (RPS) or through controls on the imports of fertilisers, at what price farmers would have got fertilisers. The difference between what cultivators would have paid under that counter-factual free-trade scenario and what they are actually paying may be termed as 'economic' subsidy to farmers. Going by this approach, first, one finds per unit cif price of urea, di-ammonium phosphate (DAP) and muriate of potash (MOP) separately, and then adds to that domestic handling charges including unloading, packing in bags, transporting to various places in the country and marketing expenses involved in the process together with the dealer's margin. In India, while fertilisers were imported by Minerals and Metals Trading Corporation of India (MMTC) on behalf of the ministry of agriculture, government of India, final handling fromthe port to the farm-gate is left to a few pool handling agencies.[13] These agencies, till 1985-86 were paid charges as determined by the government on the basis of port, type of consignment (bulk or bagged), and the destination where imported fertilisers were supposed to be made available. In 1986-87, the government introduced the 'tender system' (with effect from April 1986) with the hope of cutting down handling costs. The economic subsidy on fertilisers per unit of urea (46 per cent N), di-ammonium phosphate (18-46-0) and muriate of potash (60 per cent K_2O) has been worked out. These estimates are adjusted to derive separately economic subsidy per ton of N, P and K, and then multiplied by the respective quantities of their consumption to obtain total economic subsidy on fertilisers.

(iv) *Credit Subsidy:* From the lender's point of view credit subsidy may be looked at from two alternative hypotheses. The first perceives credit subsidy to consist of two components: (a) interest subsidy that accrues to agriculture due to concessional rate of interest being charged to this sector *vis-a-*

vis the other sectors of the economy; and (b) default subsidy which accrues to agriculture in the form of bad debts. Accordingly, interest and default subsidy has been calculated separately and then added to get credit subsidy to Indian agriculture. It should be mentioned that default also occurs in credit to non-agricultural sector and that therefore, strictly speaking, we should take into account only the additional default in credit to agriculture. The second concept perceives credit subsidy as the difference between cost of supplying credit to agricultural sector (including defaults) and rate of interest received from agricultural sector only. The information on the cost of supplying credit to the agricultural sector is, however, not available for all the states and because of this reason it is the first alternative which has been employed in the present study to estimate credit subsidy.

Magnitude of Input Subsidies

The entire set of input subsidies, i e, irrigation subsidy, electricity subsidy, fertiliser subsidy and credit subsidy were estimated as explained above. The resulting figures of input subsidies which flow to the Indian agriculture are presented in Table 2.[14] It is discernible from the data presented in the table that input subsidies in Indian agriculture increased at an annual growth rate of 12.61 per cent and 9.11 per cent respectively during the period 1980-81 to 1992-93, at constant 1981-82 prices, depending upon the way how one estimates the irrigation subsidy.[15] Among various components of subsidies, electricity subsidy exhibited the highest growth rate (19.89 per cent per annum at constant prices) between 1980-81 and 1992-93. Electricity subsidy was closely followed by fertiliser subsidy which marked a growth rate of 16.37 per cent per annum during the same period. These two were followed by credit and irrigation subsidies, which increased by 5.46 per cent and 4.82 per cent respectively during the same period. With this alarmingly high rate of increase in electricity subsidy, there was a significant change in the relative shares of various input subsidies in total amount of subsidies. It is clearly demonstrated by Figure 2 that during the triennium ending 1982-83, credit subsidy under estimate I and irrigation subsidy under estimate II, accounted for the highest shares of 36 per cent and 55 per cent of total input subsidies respectively. But during TE 1992-93, electricity subsidy accounted for the largest share of total input subsidies in both the situations. The relative share of electricity subsidy in estimate I was found to be 49 per cent, while in estimate II the relative share of the same works out 40 per cent respectively.

Among different regions of the country, western region exhibited the highest rate of growth of input subsidies under estimate I which was found to be 15.22 per cent per annum. Under estimate II, however, the highest growth in input subsidies was marked by the southern region which was found to be 9.48 per cent per annum.[16] Eastern region showed the lowest rate of per annum growth of input subsidies under both the estimates among the four regions of the country.

Figure 2: Relative Shares of Input Subsidies in Indian Agriculture

The western region also accounted for the highest share of 34 per cent of all subsidies in the country during TE 1992-93 amounting to Rs 40.97 billion (Figure 3). The western region was closely followed by northern region with a share of 29 per cent where the subsidies amounted to Rs 34.04 billion during the same period. In southern and eastern regions the subsidies during TE 1992-93 stood at Rs 32.13 billion (27 per cent) and Rs 12.03 billion (10 per cent) respectively. Under estimate II the relative shares of the four regions stood at 30 per cent (western region), 27 per cent (northern region), 26 per cent (southern region) and 13 per cent (eastern region) respectively during the same period.

In terms of per unit area, however, it was the southern region which topped the list with input subsidies amounting to Rs 922.15 per hectare of gross cropped area under estimate I and Rs 1,115.06 per hectare of gross cropped area under estimate II (Figure 2). The northern region ranked second with per hectare subsidy amounting to Rs 831.38 under estimate I and Rs 990.62 under estimate II respectively. The western and eastern regions occupied third and fourth position in terms of per hectare subsidy amounting to Rs 580.50 and Rs 737.68 under estimate I and Rs 372 and Rs 533.01 under estimate II respectively.

V
Impact of Input Subsidies

In this section, an attempt is made to capture different types of effects that these subsidies have on the economy. These are broadly categorised as fiscal effect, cropping pattern effect, environmental effect, equity effect and effect on new industries/ technology.

Direct Fiscal Effect

The very high figures of various input subsidies in Indian agriculture also point to the fact that input subsidies grew at a much higher rate compared to the total combined plan expenditure on agriculture, irrigation and special area programmes incurred by the centre and state governments during the 1980s. This is clearly brought out by Table 4. It is discernible from the data that input subsidies constituted around 52.56 per cent

of the total expenditure incurred on agriculture during TE 1982-83 under estimate I which during TE 1992-93 stood at 131.07 per cent, much above the expenditure incurred on agriculture.[17] And, under estimate II input subsidies constituted an even higher percentage of 90.23 during TE 1982-83 and 164.02 per cent during TE 1992-93 respectively. Even as a percentage of gross domestic product, input subsidies rose from 1.24 per cent during TE 1982-83 to 2.18 per cent during TE 1992-93 (75.81 per cent increase) under estimate I and from 2.13 per cent to 2.73 per cent (28.17 per cent increase) during the same period under estimate II. This indicates the heavy burden of input subsidies inflicted on the fiscal imbalance of the nation.

This is not surprising keeping in view the sharp increase in input subsidies per hectare of gross cropped area. Input subsidies per hectare of gross cropped area increased at the rate of 12.27 per cent per annum under estimate I and 8.78 per cent per annum under estimate II at constant 1981-82 prices.

The immediate impact of very high growth in input subsidies is that investment in agriculture remained stagnant during the 1980s (Figure 3). This is in sharp contrast to the trends observed in investment during the 1960s and 1970s. This happened despite the fact that gross domestic capital formation in the economy increased during the 1980s. With the stagnation in agricultural investment the share of the agricultural sector in gross capital formation in the economy also declined from 18 per cent in 1980-81 to 10.1 per cent in 1989-90.

It is worth mentioning that it is the public sector investment in agriculture which, in fact, declined significantly during this period after having accelerated to 9.59 per cent per annum during the 1970s from 2.54 per cent per annum during the 1960s (Table 6). And, since private sector investment is influenced by the public sector investment and terms of trade, this component also exhibited stagnation.

The stagnation in agricultural investment has continued even during the first three years of the current decade, i e, during the 1990s. The gross capital formation in agriculture (public and private combined), in fact, marginally declined from Rs 45.95 billion in 1990-91 to Rs 45.81 billion in 1991-92 and decreased further to Rs 45.67 billion in 1992-93 (at 1980-81 constant prices).[18]

Cropping Pattern Effect

Subsidy on irrigation through electricity and canal water causes distortion in cropping pattern in favour of water-intensive crops like paddy in Punjab and sugarcane in Maharashtra. In Punjab, rice acreage as a percentage of gross cropped area increased from 6.87 per cent in 1970-71 to 27.52 per cent in 1991-92. Similarly, sugarcane acreage in Maharashtra increased from 1.07 per cent (as a percentage of gross cropped area) in 1970-71 to 1.89 per cent in 1989-90.

Table 5: Trends in Gross Capital Formation at Constant 1980-81 Prices (1960-61 to 1989-90)

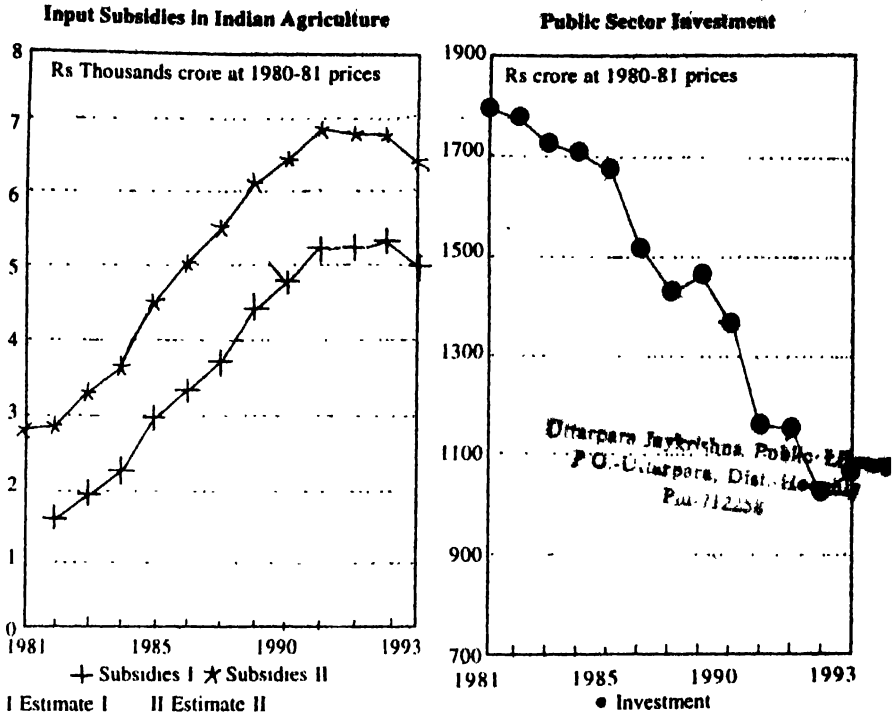
Although state level averages suppress much of the information, there would be a few districts/areas where the growth in area under these crops is very high. Because of their high irrigation requirements, these crops take a larger chunk of the scarce water (electricity) available for agriculture, and therefore thrive essentially on huge subsidies on canal waters and electricity.[19]

Environmental Effect

One of the most serious effects of input subsidy is on environmental degradation and promoting growth that is likely to be unsustainable in due course. Subsidy on canal water and subsidy on electricity has led to excessive irrigation causing salinity and waterlogging in some areas and overdraft and depletion of ground water in others. There are alarming signs of decline in water table, spread of salinity and an increase in the level of fluorides in the water. For example, Singh and Joshi (1989) point out that water table in Punjab is receding at a rate of 0.3 to 0.5 metre per year. Bhatia (1992), states in case of Gujarat that if this continues at the current pace, large parts of Gujarat will succumb to the forces of desertification. Such a continuous depletion of the water table may be undesirable and as it could lead to high levels of desertification in most parts of the country.

Subsidy on fertilisers has similarly led to excessive application with adverse environmental effects. In Punjab, the average per hectare use of nitrogen during 1993-94 stood at 126.2 kgs per hectare. Since, all cultivated area under every crop hardly comes under fertiliser use, rates of nitrogen application under a few important crops like rice and wheat must have reached a very high level. This implies that the observed level of per hectare use is much higher than the dose recommended by PAU, i e, 90 to 120 kgs for wheat and rice in the region. It is important to mention in this context that a large part of nitrogen will remain unutilised in the soil and will eventually contribute to the ground water pollution. In areas where productivity is sagging, farmers often tend to compensate it by applying higher doses of fertiliser rather than managing fertiliser and other inputs more efficiently. This substitution of 'management' by higher and higher doses of cheap fertiliser can only be stopped through widespread extension and more judicious pricing.



Equity Impact

The entire gamut of input subsidies also raises an equity question, i e, who benefits from these subsidies and are these promoting regional equity. It appears that the argument for continuation of input subsidies on the grounds of their distributive effects also stands invalidated. In case of fertiliser, for instance, it is estimated that not more than 52 per cent of budget subsidy goes to farmers (average figure from 1980-81 to 1992-93). The rest may be deemed to be going to either fertiliser industry or the industry that supplies feedstocks to fertiliser industry (e g, ONGC, IOC, etc) [Gulati and Sharma 1995].

Irrigation-based agricultural growth has diverted bulk of input subsidy to irrigated areas with serious implications not only for inter-crop parity but also inter-class and inter-region equity, i e, irrigated versus unirrigated farmers and irrigated versus dry land regions. It has been found that most of the share of input subsidies has been appropriated by fewer well-watered and well-developed regions [Subbarao 1985; Gulati and Sharma 1995]. This has unquestionably led to the neglect of unfavourable areas and these are the areas which need to be given priority in any developmental strategy in view of their widespread coverage and widespread poverty in these areas. For example, not charging for irrigation water is the biggest fraud on dry land areas. This is because resources get dried up in areas receiving early irrigation investments, and farmers in dry land areas have to wait much longer for their turn to have the resources percolate down to them. As far as the distribution of subsidies among different categories of farms is concerned, the general perception is that large farmers appropriate a larger chunk of the subsidy cake.

But this is not borne out by the data, once one examines it in relation to their share in total cropped area. In fact, relevant data reveal that it is the small farmers who have appropriated proportionately a larger share of subsidies. In Table 7 we have attempted to arrange the share of small and marginal farmers *vis-a-vis* large ones in case of irrigated area, number of tube-wells fitted with electric pump sets, fertiliser consumption and institutional credit. This is done with a view that if the share of small and marginal farmers in these inputs is higher than their share in total cropped area, it would be indicative of the fact that they receive proportionately a large share of the subsidies on these inputs.

Figure 3

Impact on New Industries/Technology

When the prices of inputs do not reflect their scarcity value, there is very little incentive for farmers to adopt methods which could make more efficient use of scarce resources. A rise in subsidies where prices do not reflect the scarcity value will accentuate these inefficiencies. This inhibits the growth of water saving or energy saving devices, which discourages investment in those industries which could manufacture these input saving devices. For example, large subsidies on fertilisers and irrigation make this seed-water-fertiliser technology relatively more attractive than bio-technology and thereby slows down the potential growth of the latter. Further, dry land farming remains unattractive because of cheap water in irrigation areas. Use of bio-fertilisers and organic manures remains restricted due to subsidies on chemical fertilisers. Thus, a potential revolution in these industries remains untapped.

The above discussion and empirical facts clearly demonstrate how input subsidies have eaten up the resources which could

have been used for creating productive potentials. This indicates that input subsidies are crowding out productive investments in agriculture. In addition to this, continued subsidies are sending wrong signals to the farmers, distorting their production baskets, leading to environmental degradation. Also, subsidies are not promoting regional and inter-personal equity, either. This calls for large-scale reforms in the area of input subdies, both in terms of their pricing as well as institutional framework. If these subsidies are eliminated or reduced and targeted, resources tied up in these can be reinvested for creating necessary infrastructure. This will not only raise productive potential but will also attract more private investments and agricultural sector will benefit in the long run. This will also help in choosing efficient cropping patterns which are in tune with region's resource endowments. This will help in reducing inefficiencies and checking environment degradation.

VI
What Is the Way Out?

The above analysis reveals the following:

(i) In the case of irrigation it is clear that there has been a gradual deterioration in the financial returns from major and medium as well as minor irrigation works. The escalating losses due to poor receipts which do not cover even the O and M expenses not to talk of investments made in the irrigation sector, have become unsustainable. The ludicrously low water rates are one of the reasons responsible for the deterioration of irrigation and drainage infrastructure in the country. Keeping in view the critical role of irrigation, poor recovery rates do not augur well for the development of this input.

The main reason for the widening gap between O and M costs and recovery rates is the fact that water rates are fixed at current prices and updated after a long period. Therefore, with the erosion of the value of rupee due to inflation, the recovery rates fall below ever rising working expenses. This can be taken care either by fixing recovery rates annually during the beginning of the agricultural year or by indexing the recovery rates [Gulati et al 1994]. It has also been realised that recovery rates should cover working expenses and a part of capital outlay. Rough estimates (according to the Committee — Pricing of Irrigation Water) indicate that raising the price of water to the extent needed to just cover the O and M expenses and above 1 per cent of the capital cost, works out only 6 per cent of the gross value of output per hectare of output per irrigated hectare [GOI 1992]. This committee, headed by Vaidyanathan, recommends raising the average water rates to Rs 310 per hectare from the existing level of Rs 50 per hectare.

In addition, the committee also recommended volumetric pricing of canal waters. It has been felt that water charges should be a function of volume of water used. If this type of tariff structure can be fixed, it will eliminate the need for fixing crop-specific water rates and estimating area under different crops. This is the only way of dealing with this situation because the distinction between cash and food crops is no longer valid. This can be done by supplying water to the user co-operatives or the group of irrigators. Initiatives should be taken to make farmers co-owners of the irrigation systems and transferring management of irrigation systems to farmers. At a recently held conference in the People's Republic of China on Irrigation Management Transfer (IMT), various approaches to irrigation management transfer were discussed. From the deliberations it appears that the experience of such attempts world over has been a mixed one. But it is being realised that greater involvement of users is imperative not just for financial reasons but for realising the full potential of irrigated agriculture [Vaidyanathan 1994]. This can be done by issuing 'water bonds' to the tune of say 5 per cent of the equity of the irrigation system [Pursell and Gulati 1993; Gulati et al 1994a]. As stated above, this would help in recovering some part of the capital cost, and also inculcate a feeling amongst farmers that the irrigation system in part belongs to them. This will induce them to take greater interest in managing the irrigation system.

These reforms in pricing of irrigation water as well as turning the system from 'tops down to bottoms up' will ensure a more efficient use of this scarce resource on the one hand and will also encourage better maintenance of various irrigation schemes on the other. This will help in smoothening the optimal supply of irrigation water, and make it more productive.

(ii) In case of electricity subsidy, the analysis shows that the type of administered pricing structure that is there creates a distortion in the pricing of this crucial input and is leading to depletion of public funds and posing environmental problems. A side effect of this has been the steep fall in the revenue of state electricity boards. This is acting as a deterrent to major investments in this sector of the economy by the private sector. To make it attractive the rates should be revised upward by replacing flat rate system with volumetric pricing and distribution of electricity should be privatised. To begin with, the minimum tariff rate charged from the agriculture sector should be revised to 50 paise per unit which should be revised every year.[20] Also, the SEBs must ensure better quality of power - both in terms of its availability as well as fluctuations. Given the high opportunity cost of this resource in a country like India, it must be charged at appropriate rates to ensure further expansion of the power sector on the one hand and to promote efficient use of power on the other. The scarcity value of this crucial input, therefore, should be made known to the farmers. The over-drawing of ground water is leading to ground water depletion and is creating environmental problems [Singh and Joshi 1989; Bhatia 1992]. If rational pricing mechanism is not introduced, the private sector will hesitate to invest money in power sector, regardless of the concessions offered. This could be done by selling electricity to user groups or co-operatives of farmers or private individuals and having them collect dues [Moench 1992; Pursell and Gulati 1993].

(iii) In case of fertiliser subsidy, although prices of phosphatic and potassic fertilisers have been decontrolled to check the rising burden of fertiliser subsidy, prices of nitrogenous fertilisers like urea continue to remain under control. This distorted pricing mechanism has changed the application rates in favour of nitrogen which is harmful to the health of the soil keeping in view the long-term implications of unbalanced use of fertilisers. The fertiliser consumption ratio has been badly disturbed. From already

TABLE 7: PATTERN OF INPUT USE AMONG DIFFERENT FARM SIZE GROUPS (ALL INDIA)
(percentage share)

Inputs	Farm Category	
	Small and Marginal	Medium and Large

distorted ratio of 6:2.4:1 (N, P_2O_5 and K_2O) in the year 1990-91, the consumption ratio vitiated to 9.6:2.9:1 in 1993-94, against a desirable ratio of 4:2:1. Keeping this in view, the prices of urea too should be decontrolled and its imports decanalised. To begin with an ad hoc subsidy such as in the case of phosphatic and potassic fertilisers could be granted. This can be done in a gradual manner spreading it over two to three crop seasons. This will give enough time for farmers to get adjusted to the new market realities. This may sound like a death-knell for the new plants that were planned with retention pricing in mind. These plants can be saved by giving a one-time capital subsidy.

(iv) The continuous rise in credit subsidy points to the burden that might have been inflicted on the rural credit. This calls for revising the interest rates upwards in order to bring the rural financial institutions out of the morass of bankruptcy. This can be done in stages before bringing it to the levels of other sectors of the economy [Katula and Gulati 1992 and Gulati and Sharma 1994b]. Some of the scholars who have tried to see the credit from the borrower's angle express that defaults are mainly due to under financing and delays in the sanctions and disbursement of loans [Kahlon 1991]. These problems can be best addressed by increasing the availability of credit and reducing the time taken to advance loans. Credit could be advanced to the groups of the farmers so that each member acts as surety for the other and in case of defaults the group could be penalised [Pursell and Gulati 1993].[21] In view of the scarcity of credit and very high rates of interest charged in the informal sector, small and marginal farmers would benefit much more from easier and timely availability of credit from institutional sources than from the low subsidised rates of interest charged [Rao and Gulati 1994]. The higher interest changes and less defaults will also help in improving the viability of rural financial institutions.

(v) The above reforms in case of input prices, however, cannot be implemented in isolation of the reforms of the output prices because as is demonstrated in Section II that despite heavy input subsidies, the agricultural sector on the whole remains net taxed. This is due to the fact that barring a few exceptions like oilseeds and sugarcane, the prices of other agricultural commodities have been kept low compared to their international levels, primarily through export controls. Therefore, the reforms on input prices must be accompanied by the reforms on output prices, otherwise it will be very difficult to carry through the above-mentioned reforms in input prices. Some progress has been made in this direction in 1994, but much more remains to be done.

(vi) In the context of reforms on input and output prices it is important to take due care that funds which are tied up in input subsidies, once withdrawn are ploughed back in creating necessary infrastructure in the agricultural sector such that the possible adverse effects of corrections in pricing are minimised and this sector can be put on the path of sustainable development.

In conclusion it is worth recapitulating the main points of this paper: that Indian agriculture is not 'net subsidised' but 'net taxed'; that overvalued exchange rate and high protection to industry has discriminated against agriculture; that subsidies on key inputs have lost their rationale and are now crowding out productive investments, damaging environment, accentuating inequity and promoting inefficient cropping patterns; that raising prices of these inputs is only a partial solution to the ills of the input sectors — they must experience institutional reforms to make the system sustainable. The sequencing of reforms in agricultural subsidies must start from liberalising the output markets, opening them to exports and thereafter involving farmers in carrying out reforms in input markets — particularly for non-tradable inputs like canal water, electricity and rural credit. It is only such a comprehensive package of reforms that can contribute towards accelerated and substainable growth of Indian agriculture.

Notes

1 The third way could be to make direct payments to the farmers to produce through adverse conditions. But this is not a commonly used method of subsidising the cultivators.

2 If we work out AMS based on the value of agricultural produce of only those crops for which AMS has been calculated, the taxation would turn out to be even higher. According to Joshi (1994), AMS based on this method stood at 68.88 per cent during triennium ending 1988-89.

3 These estimates are based on Producer Subsidy Equivalents as estimated by USDA for the period 1981-82 to 1987-88. We do not have access to their AMS for the period 1986-87 to 1988-89, but it is expected that levels of AMS are in line with PSE estimates.

4 On an average, during the 17-year period, i e, 1970-71 to 1987-88, the protection level for agriculture was about half the protection level for manufacturing [Pursell and Gulati 1993].

5 It has been observed that after 1974-75, the terms of trade in general deteriorated against agriculture [Sidhu 1993]. We have not used the data on terms of trade from the *Economic Survey*, because of the inappropriate methodology being followed in that series, which does not give any weightage in accordance with the buying/selling behaviour of farmers.

6 We feel subsidies, however, would be necessary for some time, for certain targeted groups, especially those who have little surplus to sell. But certainly, what we opine is that agriculture should have a 'level playing field' with Indian industry. In other words, let the two sectors face opening up of the economy with much lower level of tariffs and almost complete freedom to export.

7 This may raise a question as to how productivity increased during the 1980s despite fall in investment. This is because there is always a lag between investment in infrastructure and realisation of the potential created, and since a large number of projects exist in pipeline, some potential from the past investments would have been realised during the 1980s [Rao 1994]. The decline in investment in the 1980s would essentially result in reducing the potential benefits in the future. Further, the data on public investment in agriculture basically comprises of investment in major and medium irrigation schemes and ignores investment in rural roads, electrification, markets, etc.

8 The impact of declining investment on agriculture has been an area of major concern of many studies conducted in the recent past. Examples include Rath (1989), Shetty (1990), Kumar (1992), Gulati and Bhide (1993) and Rao (1994).

9 To cite an example — Mundlak, Cavallo and Domenech (1989) evaluated the effects of government policies on agricultural productivity in Argentina. They found out that heavy direct and indirect taxation of the agricultural sector had detrimental effects on agricultural productivity growth.

10 This section draws heavily from an earlier work of Ashok Gulati (1989) but refines and provides updated alternative estimates of irrigation subsidy.

11 However, there can be a difference of opinion as to which cost of capital should be considered here, i e, whether historical cost or the replacement cost. While, the historical at the prices of those years in which they were incurred would set the lower limit, the upper limit would perhaps be determined by the replacement cost at today's constant prices. By definition, replacement cost is a cost at which irrigation potential can be created today. Thus, there could be one more estimate of irrigation subsidy based on this concept. However, this has not been taken up in this study.

12 The rate of interest for this purpose could either be the rate at which government borrows its funds or the average annual redemption yield of government securities. We have considered for our purpose annual redemption yield of government securities. The reason for this choice is the fact that, interest rate at which government borrows its funds has in it an element of subsidy. This hidden subsidy is in the form of low rate of interest at which government borrows its funds.

After the rate of interest has been determined that next step is to estimate the rate of depreciation in case of major and medium and minor irrigation schemes. Assuming a life span of 100 years for major projects and 50 years for medium ones, depreciation in case of major and medium irrigation schemes would be 1.5 per cent. Finding the exact rate of depreciation in case of minor irrigation schemes is, however, quite complex because minor irrigation schemes include dug-wells, tanks, shallow tube-wells, deep tube-wells, lift irrigation schemes and so on, each of which has a different life span. Nevertheless, we have taken for our purpose 4 per cent as

the rate of depreciation, which is the weighted average of the rates of depreciation of tanks, shallow tube-wells and deep tube-wells, weights being their relative shares during the Fifth Plan period. This indicates that a representative (weighted average) minor irrigation scheme has a life span of 25 years.

13 Phosphatic and potassic fertilisers have now been decanalised.

14 The estimates of input subsidies presented here (Table 2), are different from those shown in Table 1. These variations in estimates are due to the different concepts used in estimating input subsidies. The figures shown in Table 1 are based on the methodology adopted by the ministry of commerce for working out non product specific aggregate measure of support. The other reason for variations in estimates is the fact that our current estimates (Table 2) are based on the revised information which was not available earlier.

15 If one takes into account the non-recovery of operation and maintenance charges only (estimate I), the subsidy grew at a higher rate of 12.61 per cent. But, if one includes annualised cost of capital deployed in major and medium and minor irrigation schemes in non-recovery of operation and maintenance cost (estimate II), then, the growth in subsidy was found to be 9.11 per cent.

16 Growth rates discussed here are not at current prices but at constant 1981-82 prices.

17 The estimates of subsidies presented here are different from those given in Rao (1994). These differences in estimates are due to the fact that irrigation subsidy estimated here includes subsidies in minor irrigation which are excluded in those estimates which are given in Rao (1994).

18 Some may argue that total resource flows from the government budgets to agricultural sector do not show any decline during this period. But, it may be stated that retardation in the expansion of productive potential in agriculture can occur despite there being no visible reduction in the funds allocated to this sector. This is because, such outlays are getting increasingly consumed in maintaining the already established potential and financing the rising burden of subsidies.

19 This clearly shows that there is a large-scale diversion of resources in favour of those crops which are highly water-intensive. An *ex-post* survey of ten major projects in the country showed that the cropping patterns that finally emerged in the command areas of these projects were significantly different from the *ex ante* expectations of the project authorities, and that they were tilted heavily in favour of water-intensive crops like paddy and sugarcane. Since water charges are not strictly volumetric, it implies that water-intensive crops are more subsidised than other crops. This is true despite the fact that water-intensive crops have to pay higher charges than less water-intensive crops.

20 Twice the power ministers of states have decided this, but only a selected few carried it out. Tamil Nadu gives it free to rural sector. In Karnataka, farmers using up to 10 HP get free power. This is clearly undesirable and unsustainable in the long run.

21 This unique approach of advancing loans to a group of members is being followed by the Bangladesh Gramin Bank. Instead of members approaching the bank for loan, the bank identifies borrowers from the group. At the first stage loans to only two members are issued and on a satisfactory performance the remaining members would be covered in batches of two borrowers each, subject to the satisfactory repayment performance [Dadich 1995].

Private Fixed Capital Formation in Agriculture

Some Aspects of Indian Farmers' Investment Behaviour

B D Dhawan
S S Yadav

Contrary trends in public and private components of fixed capital formation in agriculture sector have been construed in some quarters as lack of complementarity between the two investment components of agricultural capital formation. Such complementarity is believed to have existed in the planning period. This article raises some pertinent questions on the issue on the basis of an inquiry into the Indian farmers' investment behaviour through an analysis of survey data on the Indian farmers' total capital expenditure and the share of fixed capital formation in farm business in such expenditure.

THE planners have come a long way since the launching of the First Five-Year Plan when capital needs of Indian agriculture sector were deemed to be low, more so in comparison to the capital needs of industry sector. Today the capital needs of agriculture are well recognised for attaining sustained growth are in order to meet the steadily rising needs of food and fibre of our huge domestic population, as also make due contribution in earning foreign exchange through exports. Under such compelling circumstances, any decline in capital formation in Indian agriculture is bound to be a source of anxiety to planners and a valid cause for concern to scholars of Indian agriculture.

A disconcerting development has been the decline in real capital formation on government account in Indian agriculture in recent years. According to Gulati and Bhide (1993), the growth rate in fixed capital formation (FCF) in agriculture, measured at constant prices of 1980-81, declined during the 1980s to minus 0.9 per cent per annum, in contrast to a 5 to 6 per cent growth rate recorded during the 1970s and the 1960s. Fortunately, this decline is not accompanied by a like decline in agricultural capital formation on private account which constitutes one-third of total FCF in agriculture. In fact, the farmers continued to raise their own investments in fixed agricultural assets during the 1980s, though without offsetting the reduction witnessed in FCF on public account. Yet, there was quite a perceptible deceleration in private investment effort, as brought out by Table A giving data from Gulati and Bhide's working paper.

These contrary trends in public and private components of fixed capital formation in agriculture sector have been construed in some quarters as lack of complementarity between the two investment components of agricultural capital formation. Such complementarity – in the sense of public investments in agriculture stimulating private investments by farmers themselves – is believed to have existed in the planning period prior to the 1980s. Here, a number of pertinent questions arise. First, has the aforesaid complementarity between public and private investments in agriculture really disappeared in the recent years? If, so why? Is the contrariness in the two trends (public investment going down and private investment continuing to rise) indicative of substitutability in the two categories of investments? If so, what can account for this turn around in investment behaviour, from complementarity to substitution between public and private sector investments in our agriculture? Answers to these questions hinge *inter alia* on Indian farmers' investment behaviour, as also on the changes, if any, in such behaviour. In what follows an insight into that behaviour is offered through an analysis of survey data on Indian farmers' total capital expenditure and the share of fixed capital formation in farm business in such expenditure.

Data Base

A nationwide sample survey, known as the All India Debt and Investment Survey, was carried out in the early 1980s. Three volumes on the same were brought out by the Reserve Bank of India. One volume, entitled *All-India Debt and Investment Survey, 1981-82 Statistical Tables Relating to Capital Expenditure and Capital Formation of Households during the year ended 30th June 1982*, was released in late 1988, and provides valuable data on fixed capital formation in agriculture during 1981-82. Much of the information is given separately for urban and rural households. Whereas urban households are distinguished by 'self-employed' and non-self employed categories, the rural households are distinguished in most of the detailed Statistical Tables by 'cultivators' and 'non-cultivators' groupings. (Occasionally, the group non-cultivators is further segregated into 'agricultural labourers', 'artisans' and 'other non-cultivating' households.)

Preliminary sifting of the data reveals that bulk of the fixed agricultural capital formation on private account during 1981-82 was by cultivator households, which numbered about 72 million out of total rural households of the order of 94 million. More specifically, total FCF in farm business amounted to about Rs 14.5 billion, of which about Rs 12.7 billion is accounted by cultivators alone – the rest of the Rs 1.8 billion is split between urban households (Rs 1.5 billion) and rural non-cultivators (Rs 0.3 billion). We have a breakup of this fixed capital formation by states numbering 17, as also by eight asset-size categories namely up to Rs 1,000, Rs 1,000-5,000, Rs 5,000-10,000, Rs 10,000-50,000, Rs 50,000-1,00,000, Rs 1,00,000-5,00,000 and Rs 5 lakh and above. Additionally, fixed investments in agriculture are distinguished by the following eight item heads: (1) Reclamation of land; (2) Bunding and other land improvements, (3) Orchards and plantations, (4) Wells, (5) Other irrigation sources; (6) Agricultural implements, machinery and transport equipment etc., (7) Farm houses, barns and animal sheds and, (8) Other capital expenditure.

In this paper we are focusing our analysis on cultivator households who accounted for more than three-fourths of private fixed capital formation in Indian agriculture during 1981-82. Statewise total FCF in agriculture, alongwith the 18 components of this FCF, are shown in Appendix Table 1. The list of states, along with their proportionate share in FCF, is as in Table B.

The above 17 states account for 98.5 per cent of total FCF in agriculture. The rest

Table A

		Annual Rate of Increase/Decline		
		1960s	1970s	1980s
Fixed capital formation in agriculture.				
(i)	On public account	2.4	7.3	(-) 3.3
(ii)	On private account	8.1	4.2	0.3
(iii)	Total	6.3	5.2	(-) 0.9

Table B

		Per cent
1	Andhra Pradesh	8.3
2	Assam	0.9
3	Bihar	3.0
4	Gujarat	7.6
5	Haryana	4.3
6	Himachal Pradesh	0.5
7	Jammu and Kashmir	0.6
8	Karnataka	7.0
9	Kerala	3.7
10	Madhya Pradesh	6.8
11	Maharashtra	11.9
12	Orissa	1.1
13	Punjab	9.7
14	Rajasthan	7.0
15	Tamil Nadu	6.3
16	Uttar Pradesh	17.8
17	West Bengal	2.6

is accounted for by other states and the union territories. Uttar Pradesh, quite expectedly, accounts for about 17.8 per cent of all India FCFA. But next in importance is Maharashtra with 11.9 per cent share. Punjab is placed third with a share of 9.7 per cent. The three states, Punjab, Haryana and Uttar Pradesh together account for a little under one-third of all-India FCFA by cultivator households.

Magnitude of FCF in Agriculture per Cultivator

Fixed capital formation in agriculture (FCFA) on private account was rather low per rural household during 1981-82, amounting to about Rs 138 only. The same was somewhat higher for cultivator households for whom it averaged Rs 176, way above Rs 14 per non-cultivator household (Rs 51 per urban household and Rs 124 per self-employed urban household). One reason for this low investment activity is that during 1981-82 only a small proportion of the rural households invested in fixed agricultural capital. This proportion was 16 per cent for cultivators, and merely about 4 per cent for rural non-cultivators (as well as for urban self-employed households).

In this nation of continental dimensions inter-state disparities in most things, economic as well as non-economic, are quite striking. This is also true of FCFA per cultivator across 17 states. Statewise estimates of FCFA per cultivator household, alongwith six broad components, are shown in Appendix Table II. The extremely low level of such investment per cultivator household was reported from the eastern states of Orissa (Rs 38), Bihar (Rs 43), Assam (Rs 51) and West Bengal (Rs 54). The highest level of fixed capital formation was reported from the state of Punjab (Rs 915), followed by Haryana (Rs 652). Next in ranking is the state of Gujarat (Rs 322), which is closely followed by Maharashtra (Rs 304). The magnitudes for the remaining nine states stood as follows:

1 Karnataka	Rs 253
2 Rajasthan	Rs 234
3 Andhra Pradesh	Rs 187
4 UP	Rs 178
5 Tamil Nadu	Rs 164
6 Madhya Pradesh	Rs 151
7 Kerala	Rs 135
8 Jammu and Kashmir	Rs 113
9 Himachal Pradesh	Rs 103

Before we examine the determinants of the inter-state disparity in fixed capital formation in Indian agriculture, we may take note of the following additional facts about such capital formation. Capital resources sunk into fixed capital formation in the agriculture sector constitute a rather small proportion (one-fifth) of total capital expenditure of cultivator households. More specifically, out of total capital expenditure of Rs 823 per cultivator household incurred during 1981-82 only Rs 176 were directed towards fixed capital formation in agriculture. The most marked inclination in this regard was exhibited by Gujarat farmers who allocated nearly 43 per cent (as against 21 per cent for all India) of their capital outlay towards fixed agricultural capital formation, notwithstanding the fact that their capital outlay (Rs 743) was barely one-third of the corresponding magnitude of the Punjab farmers (Rs 2,336 *vide* Table 1). Of course, farmers in Punjab-Haryana region too reveal a rather well-marked preference to use capital resources at their disposal for enhancing fixed capital assets in farm activity. States revealing low preference in this regard were Kerala, Orissa, Jammu and Kashmir, Bihar, West Bengal, Himachal Pradesh and Assam (Table 1). For instance, Kerala farmers directed hardly 8 per cent of their total capital outlay of the order of Rs 1,671 (per cultivator) towards agricultural capital formation in the shape of fixed assets. In fact, we find that capital formation in agriculture by cultivators and their per cent allocation of total capital outlay during 1981-82 were well correlated ($r = 0.79$).

Because of skew distribution of income and wealth in rural areas, fixed capital formation too exhibits highly skewed pattern. For one, the proportion of cultivator households undertaki
tends to rise considerably with the asset position of a household. More specifically, whereas hardly 6 per cent of the cultivators with assets worth Rs 1,000 or less could undertake such investment, as much as 50 per cent of them with assets value above Rs 5 lakh (assets include land and household durables) were doing so during 1981-82. As for the skewness in the distribution of capital formation across cultivator households, the group of households in the asset group Rs one to five lakh (who constitute one-tenth of the total number of cultivator households in India) accounted for nearly half of the total fixed capital formation in agriculture (*vide* Table 2). Since land ownership as a dominant component of a farmer's assets in India, one can assert that the rising pattern in fixed capital formation in agriculture is fundamentally land size determined (Table C).

Finally all fixed capital formation amounts to just about three-fifths of total capital outlay, indicating non-agricultural fixed capital formation is far more important for farmers than agricultural fixed capital formation. More specifically, against Rs 176

Table 1: Statewise Capital Outlay Allocated to Fixed Agricultural Capital Formation

going into fixed capital formation in agriculture an average cultivator household in India spent about Rs 245 on capital in residential housing, and about Rs 47 in non-farm business capital. While we do not know the rate by which stock of fixed agricultural capital (excluding land) rose as a result of fresh addition of Rs 176 worth of fixed capital formation in agriculture, the same for all fixed capital formation (agricultural plus non-agricultural) for all rural households did touch a level of about 4.45 per cent in 1981-82, up from 3.98 per cent observed ten years earlier as per the RBI Debt and Investment Survey of 1971-72 (Source: Table IV, p 52 of RBI volume of 1988).

Main Components of FCFA

In Appendix Tables III and IV are listed the six main components of FCF in agriculture for each state, in absolute as well as in relative terms. The six main components are derived from the basic 18 components of Appendix Table I as follows. (1) Land improvements cover investment in land reclamation and in bunding and other land improvements, that is, columns 1+2+3 in Appendix Table I. (2) Orchards stands for 'orchards and plantations', that is, columns 4+5 in Appendix Table I. (3) Irrigation covers both wells and other private irrigation sources, that is, columns 6+7+8+9. (4) Agricultural implements comprises columns 9+10+11+12. (5) Farm buildings comprise columns 13+14+15. (6) Others comprise columns 16+17+18.

Fixed capital formation in agriculture is quite a varied basket of investment goods. Though 'agricultural implements, machinery, transport equipment, etc', is the single most important item in such capital formation - accounting for Rs 82 out of Rs 176 of fixed capital formation in agriculture (*vide* Appendix Table II), this in itself, as the heading suggests, is far from a homogeneous item. Irrigation-related capital formation is covered under two heads, namely, wells and other irrigation sources, both together accounting for about Rs 46 per rural cultivator household. That is to say, private irrigation investment constituted at least one-fourth (25 per cent) of total fixed capital formation in agriculture during 1981-82. (The rider 'at least' here reckons with the possibility that pumpsets, oil engines and electric motors used for irrigation might have been recorded under the head of agricultural machinery referred to above).

Once again, this preference for irrigation investment *vis-a-vis* other agricultural items of fixed capital formation has a regional angle to it. This is clear from statewise data listed in Table 3. We find that both in high rainfall states (Assam, West Bengal, Orissa) and in hilly states (Himachal Pradesh and Jammu and Kashmir) farmers' preference for irrigation works is rather weak when compared to their counterparts' in low rainfall states of western India (Rajasthan and Gujarat), medium rainfall states of southern India (Andhra Pradesh and Tamil Nadu), and Maharashtra in south-western India (this state tops the list, with 45 per cent allocation to irrigation alone). Probably, a more pertinent indicator of farmers' preference for irrigation development could be the irrigation outlay as a proportion of total capital outlay. This proportion was just about 5 per cent at all-India level, i e, Rs 5 out of Rs 100 of capital expenditure by cultivators were directed into irrigation works (including major repairs). According to this criterion, some reordering in state rankings occurs, whereby Gujarat cultivators come on par with Maharashtra cultivators in the matter of allocative preferences for irrigation investments. The farmers in these two states put almost Rs 14 out of Rs 100 of their capital expenditure towards enhancing their irrigation cover.

As land size rises, one expects a rise in the magnitude of fixed capital formation in irrigation. This is well borne out by the national data in Table 4.

Investment in agricultural machinery (including implements, transport equipment, etc), the single-most important item of fixed capital formation in agriculture, is taking place at a sizeable rate. At the commencement of the RBI survey of 1981-82, 90 per cent of the cultivators reported ownership of assets in the shape of agricultural machinery - the lowest percentage was from Kerala cultivators among whom such ownership was reported by 70 per cent farmers. On the whole, the value of owned agricultural machinery amounted to Rs 1,153 per cultivator (Rs 46 per non-cultivator and Rs 368 per urban self-employed household). To this stock the cultivators added about Rs 82 worth of machinery during 1981-82, resulting in about 7 per cent increase in this class of agricultural capital asset. This rate of rise is well above the corresponding rate of increase in total assets of the rural households, namely, 1.25 per cent (0.94 per cent a decade earlier). No wonder, then, the relative share of agricultural machinery in total assets of the farmers shows an upward increase. This increase in share is a continuation of a past trend: between 1971 and 1981 this share rose from 1.8 to 2.6 per cent

TABLE 4. IRRIGATION INVESTMENT IN RELATION TO TOTAL ASSETS AND LAND VALUE AT ALL INDIA, 1981-82

MP	54	151	36 (8.2)
Maharashtra	139	304	46 (14.0)
Orissa	4	38	9 (0.4)
Punjab	94	915	10 (3.9)
Rajasthan	90	234	39 (9.1)
Tamil Nadu	64	164	39 (8.1)
UP	24	178	13 (2.5)
West Bengal	3	54	5 (0.2)
All India	46	176	26 (5.3)

Note: Figures in parentheses show irrigation investment as percentage of total capital expenditure by cultivator households.

of all assets of cultivators -- no change was observed in the case of rural non-cultivator households. In proportionate growth terms, farmers acquired somewhat more of durable consumer goods than agricultural machinery as per the data available on change in composition of cultivators' assets between 1971 and 1981 (*vide* Table 5).

Across states, there exists a positive association between irrigation investments and investments in agricultural machinery by farmers (r = 0.61). This is indicative of some degree of jointness in these two categories of FCFA.

Role of Borrowed Funds

The Indian farmer is known to be heavily dependent on borrowed funds for meeting his needs of fixed capital, working capital, and special consumption requirements (like weddings, litigation, etc). Total borrowings during 1981-82 amounted to about Rs 525 per average Indian cultivator which financed almost two-thirds of his total capital outlay of Rs 823 in that year. This proportion becomes almost three-fourths when the borrowings are related to the cash component of the capital outlay of Rs 726 per cultivator, excluding thereby non-cash or in-kind capital expenditure. Thus, when we relate FCFA in to farmers' borrowings we find a strong relationship of the following type across states for cultivator households:

$$FCFA = -15.66 + 0.38\ LOAN, \quad (8.16)$$

$R^2 = 0.815$, n = 17

This relationship is still stronger when we consider only institutional borrowings only, which did account for 56 per cent of total borrowings by cultivators.

$$FCFA = 9.99 + 0.56\ CREDIT \quad (9.40)$$

$R^2 = 0.854$, n = 17

As mentioned earlier, farmers' preference for FCFA *vis-a-vis* other kinds of capital expenditures has a positive bearing on FCFA in agriculture (r = 0.79). Bringing in this preference variable improves the above relationships as follows.

$$FCFA = -.116 + 0.28 LOAN + 7.87 PREF \quad ...(1)$$
$$(6.67) \quad (3.83)$$

$R2 = 0.91$, n = 17

$$FCFA = -.90 + 0.43 CREDIT + 7.30 PREF \quad ...(2)$$
$$(8.13) \quad (4.13)$$

$R^2 = 0.93$, n = 17

where: FCFA stands for fixed capital formation in agriculture per cultivator (Rs). LOAN stands for total borrowings per cultivator during 1981-82 (Rs), CREDIT stands for borrowings from institutional sources (Rs), PREF stands for per cent share of FCFA in total capital expenditure per cultivator (per cent).

Every one rupee borrowed by an Indian cultivator during 1981-82 went into FCF in agriculture to the extent of 28 paise only. This very fraction in the case of loan funds provided to him by Indian financial institutions (co-operatives, commercial and regional rural banks, government, etc) was higher at about 43 paise per rupee of institutional loan during 1981-82. These fractional values are suggested by our multiple regression equations (1) and (2), and are thus obtained on the *ceteris paribus* condition that cultivators' preference for FCFA *vis-a-vis* other capital expenditure options (like building a residential house) are held constant (i e, not taken into account).

Determinants of FCFA

The magnitude of FCF in agriculture per cultivator shows positive association not only with external financing available from institutional and non-institutional sources but with several other factors. As already pointed out, it is positively related to farmers' preference for FCFA *vis-a-vis* other capital expenditure options. Other noteworthy factors having positive bearing on FCFA are: (1) Rate of technical progress experienced in agriculture sector (r=0.75). (2) Extent of irrigation development as connoted by gross irrigated area as a per cent net sown area of a state (r=0.79). (3) Extent of public canal irrigation development as connoted by net canal irrigated area as per cent of net sown area (r=0.65). (4) Rate of agricultural growth.

Among the negative factors are normal rainfall of a state (r=minus 0.54) and interest rate (r=minus 0.02). Thus farmers located in low rainfall states tended to have higher FCFA per cultivator than their counterparts in high rainfall states. Factors behind this inverse relationship need to be probed in depth. The very weak relationship between FCFA and interest rate on borrowings by farmers that has emerged in our own empirical analysis needs to be taken with great circumspection. We could not obtain firm data on interest rates on borrowings of cultivators during 1981-82. Our estimational effort in this regard yielded estimates with rather low variability across states (coefficient of variation = 14 per cent on a mean interest rate of 15.66 per cent per annum).

When we do multivariate analysis, we find following interesting multiple regression equations.

$$FCFA = -108.73 + 0.38\ CREDIT \quad (-3.53) \quad (7.47)$$
$$+ 5.96\ PREF + 32.76\ TP, \quad ...(3)$$
$$(3.50) \quad (2.13)$$

$R^2 = 0.9513$, n = 17

$$= -114.75 + 0.32\ CREDIT \quad (-4.24) \quad (6.10)$$
$$+ 7.21\ PREF + 1.676\ GIA \quad ...(4)$$
$$(5.18) \quad (3.12)$$

$R^2 = -.9625$, n = 17

$$= -133.66 + 0.33\ CREDIT \quad (-4.84) \quad (6.65)$$
$$+ 6.47\ PREF + 39.57\ GR \quad ...(5)$$
$$(4.81) \quad (3.48)$$

$R^2 = 0.9660$, N = 17

$$= (-)123.03 + 0.35\ CREDIT \quad (-4.26) \quad (7.1)$$
$$+ 7.60\ PREF + 4.62\ CANAL \quad ...(6)$$
$$(-5.30) \quad (2.92)$$

$R^2 = 0.9603$, n = 17

Where: TP is rate of technical progress in agriculture during 1960-80 (per cent); GR is annual rate of growth of crop sector during 1960-80 (per cent); GIA is gross irrigated area as per cent of net sown area in 1980-81 (per cent); CANAL is net canal irrigated as per cent of net sown area in 1980-81; (Other variables are defined as before in equations 1 and 2).

Thus total irrigation development in a state plays a significant role in FCF in agriculture by cultivators. Canal irrigation by itself also stimulates private investment in fixed agricultural capital. Since this category of irrigation is practically under public sector in India, one can say public sector investments in canal irrigation have e beneficial impact on fixed capital forma-

Table 5 Changing Distribution of Assets of Cultivator Households in India, 1971-81

Type of Asset	Percentages for Various Assets 1971	1981
I *Assets showing rise in share:*		
1 Agricultural machinery	1.8	2.6
2 Durable household goods	4.2	6.6
3 Transport equipment	0.8	0.9
4 Financial assets other than shares	0.8	0.9
II *Assets undergoing decline in share*		
5 Land and building	85.5	83.6
6 Livestock and poultry	6.5	5.0
7 Shares	0.2	0.1
8 Dues receivable	0.2	0.1
III *Assets showing constancy in share:*		
9 Non-farm business equipment	0.2	0.2
Total assets	100.0	100.0

tion in private account. Thus the slow-down in canal irrigation development during the 1980s could have *ceteris paribus* slowed down private investment in fixed capital in our agriculture in the same period. According to Hanumantha Rao, practically all states in India experienced decline in public investments in irrigation (*vide* Table 6).

We tried to assess the role of interest rate on borrowed funds on FCFA. Addition of this variable to the regression equation nos (5) and (6) showed that it had very weak, though negative, role in FCFA (the t-value of its coefficient was around 0.6). Its role appears in a somewhat better strength when we replace institutional credit (CREDIT) by total borrowings (LOAN) in these two equations (the t-value rises to around minus 1.75), as shown below:

$$\begin{aligned} FCFA &= 39.66 + 0.23\ LOAN \\ &\quad (0.36)\quad (5.68) \\ &\quad + 8.06\ PREF + 5.00\ GIA \\ &\quad (4.85)\quad\ (2.66) \\ &\quad 12.01\ INTEREST \qquad \ldots (7) \\ &\quad (-1.78) \\ &\quad R^2 = 0.9499,\ N = 17 \end{aligned}$$

$$\begin{aligned} FCFA &= 41.08 + 0.21\ LOAN \\ &\quad (0.38)\quad (4.68) \\ &\quad + 7.65\ PREF + 1.81\ CANAL \\ &\quad (4.70)\quad\ (2.79) \\ &\quad -11.40\ INTEREST \qquad \ldots (8) \\ &\quad (-1.73) \\ &\quad R^2 = 0.9518,\ n = 17 \end{aligned}$$

As already pointed out, irrigation and agricultural machinery are two important main components of FCFA. In fact, we find FCFA per cultivator across 17 states is well correlated with these two components. Whereas the coefficient of correlation between FCFA and irrigation investment component is 0.72, the same between FCFA and agricultural machinery is still higher, namely, 0.98. The complete matrix of correlation is listed in Appendix Table V. It is found that while institutional borrow-

ings continue to have a positive impact on irrigation investments (IRRIINVEST) on private account, normal rainfall (RAIN) emerges as a negative factor. The two variables together explain 58 per cent of the variance in FCFA through the following equation:

$$\text{IRRINVEST} = 79.24 + \underset{(3.21)}{0.06}\ \text{CREDIT} - \underset{(-2.73)}{0.41}\ \text{RAIN}, \quad \ldots(8)$$

$R^2 = 0.5804$, n = 17

This equation suggests that farmers in low rainfall states tend to improve their irrigation status much more than their brethren do in high rainfall states, and as much as 6 paise out of one rupee of institutional loan raised during 1981-82 by them went into irrigation development.

Investment in agricultural machinery (including implements, transport equipment, etc) bears positive relation with total borrowings (r=0.85), institutional borrowings (r=0.87), farmers' preferences for FCFA (r=0.73), rate of growth in agriculture, and technical progress in crop sector, as also (r=0.76), with irrigation investment (r=0.61) as already pointed out. Again, this component too bears a negative relation with rainfall variable – but it turns out with a statistically insignificant (and positive too) coefficient in multiple regression analysis. Two noteworthy equations are as follows:

$$\text{AGMACHIN} = -140.64 + \underset{(-2.12)}{0.15}\ \text{CREDIT} + \underset{(2.60)}{4.74}\ \text{PREF} + \underset{(4.12)}{2.37}\ \text{GIA} + \underset{(0.17)}{0.05}\ \text{RAIN} \quad \ldots(9)$$

$R^2 = 0.9325$, n = 17

$$= -152.92 + \underset{(-2.02)}{0.19}\ \text{CREDIT} + \underset{(2.59)}{5.32}\ \text{PREF} + \underset{(3.47)}{6.28}\ \text{CANAL} + \underset{(0.19)}{0.06}\ \text{RAIN} \quad \ldots(10)$$

$R^2 = 0.9186$, n = 12

Our attempt to relate agricultural machinery investment (AGMACHIN) to irrigation investment of the same year does not reveal

APPENDIX TABLE VI: STATEWISE VALUES OF TWELVE VARIABLES

State	(X1)	(X2)	(X3)	(X4)	(X5)	(X6)	(X7)	(X8)	(X9)	(X10)	(X11)	(X12)

Note. The variables are the same as in Appendix Table V.

complementarity but substitution between the two in multiple regression framework. Together these two major components show the following behavioural relations:

$$\text{IRRMACHIN} = -168.83 + \underset{(4.71)}{0.21}\ \text{CREDIT} + \underset{(6.83)}{8.81}\ \text{PREF} + \underset{(4.21)}{5.99}\ \text{CANAL} \quad ...(11)$$

$$R^2 = 0.96,\ n = 17$$

$$= -104.48 + \underset{(3.32)}{0.18}\ \text{CREDIT} + \underset{(6.08)}{8.37}\ \text{PREF} + \underset{(3.87)}{2.09}\ \text{GIA} - \underset{(-0.60)}{3.37}\ \text{INTEREST} \quad ...(12)$$

$$R^2 = 0.96,\ n = 12$$

Main Conclusions

Indian farmers allocate a rather small proportion of their total capital funds – self-owned plus borrowed ones from institutional and non-institutional sources – towards fixed capital formation in agriculture (FCFA). Though there is a marked difference across states, we find the inter-state disparity in FCFA per cultivator, high as it is (CV = 100 per cent), is well correlated (r=0.79) with farmers' allocative preference for FCFA to other capital expenditure options like investment in housing, purchase of land, and acquisition of household durables.

This allocative preference for fixed capital formation in agriculture is in turn positively influenced by a host of factors, notably the condition of agriculture in terms of technical progress in the state crop sector (r=0.61) and availability of institutional credit in the countryside (r=0.61). Among the negative influences is high rainfall of a state (r=minus 0.66), but we must hasten to add that this needs to be interpreted with caution. For one, states having high rainfall have experienced slower technical progress during 1960-80 (r= minus 0.59), have less development of institutional funding sources for farmers (r = minus 0.32), have had much less development of public canal irrigation (r = minus 0.39) in particular and total irrigation (r = minus 0.42) in general. Thus we cannot affirm with certainty that farmers in high rainfall states *ceteris paribus* tend to invest less in FCFA than do their brethren in low rainfall states.

Across states, variations in the level of FCFA per cultivator household are well understood in terms of inter-state differences in availability of institutional credit, the coefficient of correlation being as high as 0.92. Thus, private capital formation in agriculture is highly dependent on the availability of funds to cultivators from co-operative societies, co-operative or rural regional and commercial banks government departments, etc. In point of fact, such institutional financing accounted for Rs 525 out of total capital expenditure (in cash terms) of Rs 726 per cultivator during 1981-82. Thus, nearly three-fourths of the capital resources expended by farmers originated from institutional sources.

Fixed capital formation in agriculture is found to be positively associated with public investments in canal irrigation, when such investments are viewed in cumulative terms. This is suggested by the existence of a fairly high correlation (r=0.65) between FCFA during 1981-82 and the canal irrigation development in a state by 1980-81. In view of this fact the absolute decline in real public investments in Indian irrigation sector in practically all the Indian states during the 1980s must have *ceteris paribus* diminished FCFA on private account in the same period. Since public investments in irrigation do constitute a lion's share in total public investment in agriculture in India reduction in their magnitude could explain the deceleration in FCFA on private account during the 1980s - the annual rate of increase in FCFA on private account dipped from the sizeable level of 4 per cent during the 1970s to merely 0.4 per cent during 1980-88.

The upshot of our analysis is that the thesis of complementarity between public and private investments in agriculture cannot be given up in favour of the substitutability thesis being suggested on the basis of recent data from the National Accounts Statistics of the CSO.

Appendix Table IV: Statewise Per Cent Share of Components of FCFA, 1981-82

State	Land Improvements	Orchard	Agricultural Irrigation	Agricultural Implements	Farm Buildings	Others	Total

X1 = Fixed capital formation per cultivator in agriculture in 1981-82 (Rs);
X2 = Total borrowings per cultivator during 1981-82 (Rs);
X3 = Institutional borrowing per cultivator during 1981-82 (Rs);
X4 = Share of X1 (FCFA) in total capital expenditure per cultivator during 1981-82 (per cent);
X5 = Value of land productivity during 1980-83 (Rs per ha);
X6 = Annual compound rate of growth in land productivity of crop sector during the two decades of 1960s and 1970s (per cent);
X7 = Interest rate on interest-bearing borrowings in 1981-82 (per cent);
X8 = Normal rainfall of a state (cm);
X9 = Irrigation investment per cultivator in 1981-82 (Rs);
X10 = Investment in agricultural machinery in 1981-82 (Rs);
X11 = Total gross irrigated area (GIA) as per cent of net sown area (per cent);
X12 = Net canal irrigated area as per cent of net sown area (per cent).

DISCOUNT AND FINANCE HOUSE OF INDIA LIMITED

Regd. Office: 306-307 Varma Chambers, 3rd Floor, Homji Street, Fort, Bombay-400 001.

Statement of Shri S. S. Tarapore, Chairman of the Board of Directors of Discount And Finance House of India Limited at the Seventh Annual General Meeting held at Bombay on September 22, 1995

I have great pleasure in welcoming you all to this Seventh Annual General Meeting of the Company.

Performance during 1994-95

The report of the Directors and the audited accounts of the Company for the year ended March 31, 1995 have already been circulated and, with your permission, I shall take them as read. I would, however, like to outline the salient developments in regard to the Company's performance during the year under review. When the Company was established in 1988-89, the Mission given to it was to promote secondary market activity in the short-term money market and in particular to develop the treasury bill market. During the financial year 1994-95, the secondary market turnover of the Company in treasury bills was Rs. 30,921 crore or 54 per cent higher than that during the preceding year. The bulk of the turnover in treasury bills was however, under 'repo' transactions, which stood at Rs. 26,538 crore or 86 per cent of the total turnover in treasury bills. A large part of the repo transactions by the Company were undertaken mainly during January-March 1995 with a view to stabilising conditions in the money market. With the distinctly large volume of repos in treasury bills, the Company's turnover in the call money segment, which aggregated Rs. 5,22,154 crore, was somewhat lower than the turnover of Rs. 5,84,048 crore in the previous year. Correspondingly, the Company's daily average call lending stood somewhat lower at Rs 1,431 crore in 1994-95 as against Rs. 1,600 crore in the preceding year. The turnover in Government dated securities in the secondary market aggregated Rs. 12,488 crore as compared with Rs. 14,388 crore registered in the previous financial year. Notwithstanding a steep drop in the overall volume of 'eligible' Commercial Bills outstanding in the system during the last few years, the Company's turnover registered some increase at Rs. 332 crore as against Rs. 32 crore achieved in the previous year.

The Company's profit before depreciation and taxation during 1994-95 stood at Rs. 83.96 crore as against Rs. 125.28 crore in 1993-94. Net profit for the year worked out lower at Rs. 44.26 crore as compared with Rs. 58.51 crore registered in the previous year. The lower profit for 1994-95 is to be viewed in the context of higher income received in 1993-94 due to recovery of outstanding dues of the erstwhile Bank of Credit and Commerce International, tighter liquidity conditions in the second half of the year leading to higher cost of funding stocks carried by the Company for its normal trading operations and higher depreciation. Your Directors have proposed the appropriation of the net profit of Rs. 44.26 crore as under:

Transfer to General Reserve	Rs. 14.26 crore
Dividend	Rs. 30.00 crore
	Rs. 44.26 crore

Your Directors have recommended a dividend of 15.00 per cent (subject to tax) for the year ended March 31, 1995, i.e. the same rate as in the last year. The track record of the performance of the Company over its seven years of operations is set out in the following table:

Year (Ended March 31)	Net Profit after depreciation and taxation (Rs. crore)	Dividend (Percentage)
1989	5.25	5.00
1990	12.14	10.00
1991	26.97	11.50
1992	40.92	12.50
1993	45.17	15.00
1994	58.51*	15.00
1995	44.26	15.00

* Includes recovery of old dues of the erstwhile BCCI.

Taking into account the proposed appropriation, the net owned funds of the Company would be Rs. 289.82 crore or equivalent to 10.15 per cent of the Company's total assets. An institution like the DFHI has to recognise the uncertainties in the money and securities market and the endeavour should be to gradually build up the net owned funds to a level equivalent to say 25 per cent of its balance sheet.

Review of Operations during the Current Financial Year

During the current financial year so far (upto September 8, 1995), the turnover of the Company has been as under:

(Rs. in crore)

	1995-96 (Upto Sept. 9, 1995)	1994-95 (Upto Sept. 9, 1994)
Call/Notice/ Term Money	2,22,987	2,46,419
Treasury Bills	9,051	7,238
	(8,363)	(4,486)
Commercial Bills	96	48
Certificates of Deposit		
Commercial Paper		
Government Dated Securities	12,775	1,375
	(12,642)	(1,095)

(Figures in bracket indicate turnover under repo)

These figures bring out the comparative performance of the Company for the first half of the current financial year (upto September 8, 1995). It will be seen that the aggregate lending by the Company in the call/notice/term money market at Rs. 2,22,987 crore was somewhat lower as compared with the turnover of Rs. 2,46,419 crore achieved during the corresponding period of the preceding year. An underlying factor for the subdued level of activity in the call and notice money market could be the preference shown by the banks for 'repo' deals in permissible Government dated securities and auction treasury bills, basically as a means of hedging against volatility in call rates and to ensure availability of funds over elongated period

time rather than on a daily basis, to comply with the cash reserve requirement, with effect from January 7, 1995 of maintaining at least 85 per cent of the average CRR on each day of the first 13 days of the fortnight. Over a period of time this is expected to reduce the volatility in intra-fortnight volume of call money transactions.

In regard to the treasury bills segment, the turnover in the current financial year so far at Rs. 9,051 crore is higher by 25 per cent than the level of Rs. 7,238 crore recorded in the corresponding period last year, though the proportion of repo transactions has risen. The Company's turnover at Rs. 12,775 crore in Government dated securities has been substantially higher than the turnover of Rs. 1,375 crore in the corresponding period of the last year, but here again repos account for almost the entire turnover.

Your Company has been participating in all the treasury bills and Government dated securities auctions held by the RBI. Its success ratio at the auctions (i.e. the ratio of cumulative amounts allotted to amounts bid), during the current financial year so far upto September 8, 1995, was 44 per cent in case of the treasury bills and 42 per cent for Government dated securities which clearly meets the ratios stipulated in the Primary Dealer guidelines.

The implicit cut-off yields in respect of both 91-day and 364-day treasury bills auctions, which were on the increase from December 1994 onwards till the end of the last financial year, maintained their northward trend. In the case of 91-day treasury bill the yield touched a peak of 12.97 per cent in the auctions held on July 14 and 21, 1995. Similarly, the implicit cut-off yield for 364-day treasury bills rose to a peak of 13.16 per cent in the auctions held on July 18, 1995 and August 2, 1995. With the easing of conditions in the money market, in the subsequent auctions there was a gradual softening of cut-off yields coupled with a broadening of market participation, both in the case of 91-day and 364-day treasury bills.

The net borrowing of the Central Government during the current year through various market instruments has been placed at a little over Rs. 27,000 crore, the gross borrowing being a little below Rs 41,000 crore. In view of the large size of the borrowing requirements, Government had to tap the market more frequently during the current financial year and this has put a pressure on interest rates. In recent months however, the interest in Government paper has revived and the last four floatations have received a good response.

Concluding Observations

In the second half of 1994-95 institutions like the DFHI were able to provide massive liquidity support to the short term money market essentially because the Reserve Bank of India in turn provided support to these institutions. In the current financial year the increase in RBI credit to Government has been very large and it is clear that the Reserve Bank will not provide as large a support to the money market in the second half of 1995-96 as was provided in the second half of 1994-95. Thus, market participants should so order their operations that they avoid large asset-liability maturity mismatches. While the DFHI would endeavour to fulfil its assigned role it can do so only within the limits of resources available to it.

The Primary Dealer (PD) system is expected to be operationalised shortly and your Company has applied for being accredited as a Primary Dealer. The PD system would need a run in phase as PDs acclimatise themselves to their functions, obligations and prerogatives. The development of a secondary market in Government securities cannot end with the setting up of a PD system. Ultimately, for a secondary market with depth to develop what is required is a series of layers of satellite dealers right up to the retail level of individual investors. It is only by radiating out to successively larger number of dealers that the market would acquire depth. How these successive layers are to be developed is going to be a crucial issue in the ensuing period. While market structures need to be evolved, I would like to stress a few essential aspects. First, in a healthy securities market there is a need to have participants with different perceptions and different liquidity needs. Secondly, while repos are useful for providing an element of liquidity, the security market cannot develop exclusively on the basis of repo transactions. Repos can at best be only a modest segment in a market which essentially has to develop in outright purchases and sales. Thirdly, competition among PDs and their satellites will emerge and this will put a pressure on margins and your Company will endeavour to achieve a qualitative improvement in the efficiency of its operations. Fourthly, the Government securities rate is emerging as a reference rate in the system and as such it is necessary that there should be a modicum of stability exhibited by these rates. While the size of the Government's borrowing programme is an important factor determining the movements in Government security interest rates, market participants must recognise that these operations should eschew from extremely sharp interest rates movements as witnessed in the past two years wherein both the fall and rise of interest rates have been disproportionate to what was warranted by fundamentals. Fifthly, there is a need to move rapidly to a fully marked to market system for valuation of Government securities and this will foster a larger volume of secondary market transactions.

It may be recalled that at the last Annual General Meeting of the Company, I had indicated that it was time for the Reserve Bank of India to divest in a phased manner, part of its share holding in DFHI in favour of other share holders. In the first phase of the divestment process, the share of the RBI in the total paid-up capital of the Company was reduced from 51 per cent to 36.7 per cent. In the next round of divestment, the Reserve Bank has offered, on a proportionate basis, to sell its shareholding to reduce the Reserve Bank's share to 26 per cent. Furthermore, the Reserve Bank has offered to sell additional shares to other participants so as to enable the Reserve Bank's share to come down significantly below 26 per cent. The response has been encouraging and when the present round of divestment is completed, the share of the Reserve Bank is expected to be small. The DFHI after seven years of existence has grown into a strong and effective organisation and as envisaged by its founding fathers, the time is now apposite for the Reserve Bank of India to hand over the baton to other participants. Accordingly, after the present divestment is completed the Reserve Bank of India will relinquish the Chairmanship of the Company.

Acknowledgement

Before I conclude, I must express our deep sense of sorrow at the sad demise of Shri S. S. Nadkarni, who was one of the founder Directors of the Company. Shri Nadkarni played a pivotal role in the setting up of the DFHI and provided great encouragement to the Company by his unstinted support and sagacious advice.

Sarvashri N Vaghul and T N Anantharam Iyer, who were reappointed as Directors by the Members at the Fifth Annual General Meeting are retiring by rotation at this Annual General Meeting and have expressed a desire not to be considered for re-election. Shri Vaghul was the Chairman of the Working Group on the Money Market which recommended the setting up of the DFHI and he was one of the first Directors and he contributed significantly towards the Company's growth and development during its initial years. Shri Iyer as the first Managing Director of the DFHI from 1988-91 was instrumental in building up the DFHI and subsequently the DFHI was privileged to have the benefit of his continuing advice as a member of the DFHI Board. On behalf of the Company, the Board of Directors and on my own behalf, I wish to record our gratitude to Sarvashri Vaghul and Iyer.

I take this opportunity to sincerely thank the Government of India, the Government of Maharashtra, the Reserve Bank of India, the commercial and co-operative banks and all-India financial institutions for their wholehearted co-operation and support. I would like to place on record my appreciation of the painstaking efforts of the Company's dedicated team of officials for the good performance of the Company for the seventh year in succession.

Consequences of Crossbreeding Programme in India

S V N Rao
V Venkatasubramanian
Jan De Wit

Crossbreeding with exotic dairy cattle has been extensively adopted since 1963. This paper reviews the crossbreeding programmes and analyses its desirable and undesirable consequences.

CONSEQUENCES are the changes that occur to an individual or to a social system as a result of the adoption or rejection of an innovation/technology. The technologies are often introduced into the system with the expectation that the consequences will be desirable, direct and anticipated. However, adoption of such technologies may result in some unanticipated consequences which can be indirect and undesirable for the members of the system [Rogers 1983]. Crossbreeding technology is no exception to this. Through this paper, an attempt is made to analyse both desirable as well as undesirable consequences as a result of the implemen-tat.on of crossbreeding programme in India

Crossbreeding with exotic dairy breeds in cattle was introduced in the country to increase milk production through rapid improvement in the germ plasm of our native breeds. Though, introduced in India in the beginning of this century it was implemented on a large scale with the introduction of Intensive Cattle Development Project (ICDP) in 1963 as a part of Special Development Programme in Third Five-Year Plan period.

Currently crossbreeding is being implemented through a number of artificial insemination (AI) centres under the state animal husbandry departments, milk federations, voluntary organisations and organised dairy farms and universities It was reported that every year about 12.75 million inseminations with exotic bull semen were being done by all the AI centres in the country. All these efforts led to the production of about 8.8 million crossbred cattle and the contribution of these animals to the milk pool was not as significant as it was expected [Nair 1989]. However, Dhas (1991) reported that the proportion of crossbred cows in the milch animal herd as one of the factors which played a dominant role in rapid increase in the milk production of Kerala.

The information on crossbred cattle population was made available for the first time through quinquennial livestock census conducted in 1982. The census figures (Table 1) indicated that crossbred population constitute about 4.6 per cent of the total cattle population in the country. Two states, Uttar Pradesh and Kerala account for about 50 per cent of the country's total crossbred population It is fascinating to observe that a large number of indigenous cattle were replaced by crossbreds in Kerala up to the tune of 46 per cent which was further increased to 56 per cent by 1990

Crossbreeding Policies

Crossbreeding programme has generated lot of controversy since its inception. The literature is full of arguments in favour and against implementation of this sensitive programme in India. It used to be at the crossroads on a number of occasions whenever the programme was slated for discussion. For almost a century our planners tried to find answers for the two questions: (i) Whether crossbreeding is to be implemented on a mass scale and if so in which regions; (ii) What type of B taurus breed is to be used and what should be the most optimum level of exotic inheritance?

The Royal Commission of Agriculture (RCA) appointed by the then government of India in 1926 recommended that the state departments not take up experiments on crossbreeding and confine themselves to the improvement of milking qualities of indigenous breeds like Sahiwal, Sindhi or selected strains of breeds like Hariana. The animal husbandry wing of the board of agriculture and animal husbandry in India (1940 and 1941), though feeling the urgent need to increase milk production, did not recommend crossbreeding with European breeds. The Indian Council of Agricultural Research (ICAR) based on the recommendations of Gosevasangh in 1949 recommended to develop large non-descript population into dual purpose animals combining draft and milk qualities in an optimum manner. Though the crossbreeding of Indian cattle was introduced as early as 1875, it has attracted the attention of our policy-makers and planners in the year 1961.

Large scale crossbreeding was opposed by various experts in the past [Oliver 1938; Peparali 1947]. Later in 1953, Zal R Kothavalla in the 10th meeting of animal husbandry wing recommended crossbreeding not as a policy for universal adoption, but as a policy to be adopted in areas where the improvement of indigenous cattle through grading was not possible and in areas where there was great scope for augmenting the milk output

In 1961 the committee set up by the Central Council of Gosamvardhana recommended that crossbreeding of cattle to be taken up intensively using two or more exotic breeds in three selected areas one each in plateau, plains and hills Similarly, Intensive Cattle Development Projects (ICDPs) were started in 1964 as a part of the special development programmes in later half of the Third Five-Year Plan. Crossbreeding of bovines through AI technique by introducing exotic breeds like Jersey, Holstein Friesian, Brown Swiss, etc, to augment the milk production and to improve the breeding efficiency of bovine was given the prime importance under ICDP.

After thoroughly reviewing the cattle breeding policy the scientific panel on animal husbandry in 1965 recommended that bulk of the exotic inheritance should be obtained through Jersey and crossbreeding with Brown-Swiss and Holstein-Freisian should be tried on a limited scale. Similar recommendations were made by the National Commission on Agriculture (NCA) in 1976. Experimentation on crossbreeding of different indigenous breeds with different exotic breeds in different parts of the country was initiated to develop a crossbred cow to suit to our requirements. As a result a number of crossbreds were evolved with different levels of exotic inheritance including triple crosses. But the systematic efforts in a few places led to the development of new breeds such as Jersind (Allahabad Agricultural Institute), Karan Swiss and Karan Fries (National Dairy Research Institute, Karnal), Sunandini (Kerala). Despite all these efforts and loss of valuable time it is a pity that most of the states have no well defined breeding policy even now, regarding areas where crossbreeding is to be taken up, exotic breed to be used and optimum level of exotic inheritance [Acharya 1989a].

Consequences

With a view to develop a clear-cut breeding policy a number of studies were conducted to compare the performance of different crossbreds with varying levels of exotic inheritance and indigenous breeds of cattle

on the basis of data obtained from organised herds maintained in different agro-climatic zones.

After a thorough review on cattle and buffalo breeding, Bhattacharya (1984) concluded that crossbred cows are more suited for high milk production than buffaloes and the former not only produce more milk than the indigenous cattle breeds and buffaloes, but are more efficient in converting feed into milk, and thus have lower cost of milk production per litre. Similarly, Acharya (1989) on the basis of the performance data available on crossbreds in different regions remarked that crossbreeding in cattle resulted in increased milk production and helped to a great extent in rural development.

A number of studies were conducted in the past to analyse and compare different crosses with different indigenous breeds of cattle on various parameters. Most of these studies were based on the data obtained from the organised herds. A detailed review on dairy cattle crossbreeding in the tropics is available in Cunningham and Syrstad (1987). However, there are a few studies aimed at comparing the performance of crossbreds with non-descript cattle under field conditions and this article limits its discussion only to these studies. In addition it does not appreiciate the differences within the crossbreds as well as within the indigenous cattle. Similarly, the differences between HF cross and Sahiwal cows are smaller compared to indigenous cows but it was attempted to compare crossbreds and indigenous cows to facilitate presentation.

The data reported by various workers on comparative performance of crossbreds and indigenous cattle was compiled and presented in Table 2a,b and c. A glance at this table revealed that crossbreds came into first heat at an early age which ranged from 25 to 33 months compared to 38 to 41 months in indigenous cattle. Pandey and Mishra (1985) observed that about 80 per cent of the crossbreds came into first heat between two to three years as against only 50 per cent in indigenous heifers.

The conception rate through AI in crossbreds was higher than in the indigenous cattle as reported by Katpatal (1977) and Staempfli et al (1984). The literature convincingly indicated that the age at first calving of crossbred heifers under field conditions was around one year less than their indigenous counterparts [Pandey and Mishra 1985; Singh et al 1986(a) and Staempfli et al, 1984].

The avearage dry period in indigenous cows was more than six months whereas it was less than four-and-a-half months in crossbreds [Patel et al 1980 and Vanduc and Taneja 1984]. With reference to the average calving interval substantial difference between crossbreds and indigenous cows could not be observed though the former had lesser calving intervals. All these parameters discussed above lend credence to the fact that crossbreds are superior milk producers than indigenous cows. The average figures on lactation length as reported by Patel et al (1980), Vanduc and Tancja (1984) and Singh et al (1986a) showed that crossbreds were at least two months more in milk than indigenous cows. The difference in the average lactation yields of crossbreds and indigenous cows was quite substantial revealing thereby that crossbreds were high milk yielders compared to indigenous cows. Similar observations were made earlier by McDowell (1984) based on the data obtained from a number of countries on the performance of the crossbred animals.

Crossbred cows are more profitable to maintain than indigenous cows. Probably because of this the farmers (in places where there is emphasis on crossbreeding) value crossbred females much more than indigenous females. They also take more care and feed the crossbred cows better. There are reports that the farmers in Operational Research Project (ORP) area of Karnal earned about Rs 14 million through the sale of crossbred animals [Singh 1991]. For this reason farmers like to possess and maintain crossbred heifers and cows for sale rather than for milk production in Haryana. The reverse argument holds good for farmers of Karnataka and Maharashtra where organised remunerative market and increased demand for cow milk are available. The reasons attributed by George and Nair (1990) for the spectacular success achieved in implementing the crossbreeding programme in Kerala were a growth in demand for milk, increased returns from milk production, decline in the requirements of work animals in agriculture and expansion of the market for beef.

All these field studies reviewed clearly indicate that crossbred cows outdo the indigenous cows on various reproduction and milk production parameters. Though there are no reportsindicating the extent of contribution of crossbred cows in total milk production, crossbreds must have contributed to some extent in increasing the milk production which is a desirable consequence. Vaidyanathan (1989) remarked that crossbreeding technology may contribute to increase in milk production, but it will be at the expense of draught power availability in the small and marginal farms and increased application of fossil fuel to the agricultural sector.

Researchers had attempted to compare the draught power of crossbred bullocks with that of indigenous bullocks on various parameters such as draught power, speed output, ploughing ability, physiological

responses, work efficiency, feed conversion efficiency and their performance under different climatic conditions (Table 3).

The studies [Nagpaul et al 1984; Upadhyay and Madan 1985; Sreekumar and Thomas 1990] were indicative of the hypothesis that crossbred bullocks were inferior to indigenous bullocks in terms of draught power, ploughing ability and work efficiency. Crossbred bullocks showed distress with increased loads and they had less heat adaptability than indigenous bullocks [Thomas and Pearson 1985 and Sreekumar and Thomas 1990]. The indigenous animals were reported to be superior to crossbreds in their work efficiency and rate of recovery from stress caused by work. Similarly crossbreds were observed to show distress symptoms in carrying increased loads [Nagpaul et al 1984 Upadhyay and Madan 1985 and Bhosrekar and Mangurkar 1989] With increased duration of work hours crossbreds showed more distress symptoms than indigenous bullocks [Acharya et al 1979; Gattewar 1983, Bhosrekar and Mangurkar 1989 and Sreekumar and Thomas 1990]. However, Acharya (1989) was of the view that most of the crossbreds, especially halfbreds, performed better than the indigenous males because of their size

Farmers were also of the view that crossbred male calves do not become good bullocks [Patel et al 1980]. Probably because of this feeling crossbred male calves were neglected after birth resulting in their poor growth, pot belly condition, rough hair coat, and the majority of them were eliminated through natural death George and Nair (1990) reported that all holdings surveyed in Kerala sold their male calves This explains to some extent the reason behind fewer crossbred male calves in less than one year and one to two-year categories. There is no denying the fact that crossbred male was an unwanted calf but because of religious considerations the farmers, instead of culling it through slaughter, wait for its natural death or leave it in public places The same thing holds good for the 'desi' calves as well. In the process the country is losing a number of crossbred males without them contributing anything to Indian economy

It is true that as a whole there is a decline in the draught animals, may be because of the decline in the average size of landholding as was the case in Tamil Nadu [Dhas 1989] and Kerala [Vaidyanathan 1989] or to the increased intensity of agricultural mechanisation in states like Punjab and Haryana.

Comparative studies on draught power clearly revealed that crossbred bullock is no match for indigenous bullock in heat, adaptability and draught potential in summer and hot humid climates. There were no definite indications on other parameters As the crossbred male is neglected right from the birth there may be less opportunity for

the crossbred bullocks to prove their worth. The poor demand for crossbred bullocks could be explained by the fact that they consume more water and are unable to bear heat stress. There were isolated cases where the farmers changed their system of ploughing by shifting to early morning and evening hours for utilising the services of crossbred bullocks the price of which is very much lower than indigenous bullock pairs. Hence, evolution of crossbred males as a sequel to the implementation of cross-breeding programme is a negative or undesirable consequence especially when viewed against the fact that bullock power continues to be the mainstay for agricultural operations in the years to come.

It is often argued that crossbred animals are susceptible to diseases and hence need more care. Studies reflecting this feature under field conditions are scanty. On the basis of field data Venkatasubramanian and Rao (1991) concluded that crossbreds were more prone to diseases than indigenous cattle. The studies conducted on organised herds revealed that the incidence of gastrointestinal disorders, FMD, Pox and eye problems were reported to be high in crossbreds as compared to Red Sindhi, Sahiwal and Tharparkar breeds [Singh et al 1986b]. Sharma and Jain (1984) observed that crossbreds suffered higher prenatal calf losses than purebred zebu. The incidence of theileriosis was observed only in crossbreds and not a single case is reported either in indigenous cattle or buffaloes [Rao and Sohal 1985; Venkatasubramanian and Rao 1992]. As a result the crossbred cattle owners have to get their animals vaccinated against various diseases which include foot and mouth, rinder pest, theileriosis, etc. or get them treated if affected with the disease which is very expensive

However, if proper care is taken through regular vaccinations the mortality rate in crossbreds can be checked to a great extent as was the case in the adopted villages under ORP of Karnal. The mortality rate would have been more than that of the local zebu cattle had there been no difference between crossbreds and local cattle in their management, feeding and health care [Patel et al 1980]. Despite the fact that NDRI herd is being maintained under excellent management conditions the incidence of retained placenta and metritis was more in Karan Fries cows than in Sahiwal cows [Annual Report NDRI, 1985].

These reports confirm the fear that if proper steps are not taken poor but resistant local cattle in due course of time will be replaced by disease-prone crossbreds which is certainly an undesirable consequence. At the same time it is also possible to exploit the potentiality of crossbreds by providing proper health care and management.

It is argued that with the implementation of crossbreeding programme in India much of the indigenous germ plasm is being lost. It is true to a great extent in many organised herds in the country, which were up to then, having some of the best indigenous cows. For instance at NDRI, Karnal there used to be quite a good number of indigenous breeds of animals during 1965. With the emphasis on crossbreeding gained momentum these animals were replaced by crossbreds. It is clear from Table 4 that Tharparkar and Red Sindhi had vanished from the herd by 1988. Of late, few Tharparkar animals were injected into the herd. At this juncture it is apt to quote Hermitte (1989) who stated in unequivocal terms that "the pressure to provide the farmers with more productive breeds in third world countries could be harmful. It is indeed tempting to import cattle, transfer embryos into surrogate females, increase inseminations (which are not well supervised) and to carry out crossbreeding (that might erase the qualities of both breeds). The unfortunate result is that a poor but resistant type of livestock could be replaced within a few generations by a totally unadapted one." He also remarked that crossbreeding as well as substitutions of certain breeds for others may mean destroying the local ones although they are still needed. Similar views were also expressed by Acharya (1989b). Cross-breeding, therefore, resulted in a negative genetic development of these indigenous breeds, which is certainly an undesirable consequence.

Crossbred can produce more milk but they need more feed to exploit this potential. Pandey and Mishra (1985) estimated an average cost of feed of Rs 2 for indigenous cows and Rs 6.8 for crossbreds. This, however, depends heavily on the (variable) prices of the various feeds Crossbreds need more and better feed not only because they produce more milk but also due to their higher body weight which increases their maintenance requirements. Compared with a non-decrepit cow of 250 kg, a crossbred of 350 kg needs per day around 0.6 kg of TDN and 0.1 kg of CP more just to maintain its body functions, which equals about 1.2 to 1.6 kg of milk (based on NRC, 1989 assuming equal maintenance requirements per kg. Crossbreds also need higher quality feeds because the intake of feed is not increased to the same magnitude as the increased requirements. The plus point for the native cattle is that they can eat and survive on more of poor quality roughages while exotic breeds of cattle might lose weight or even starve [Orksov 1964].

The economic feasibility of feeding of high quality feeds, like concentrates, depend upon their availability and prices in relation to output prices. As a rule of thumb, feeding of concentrates is beneficial if the prices of concentrates to milk are in the ratio lower than 1:1.25, assuming that 1 kg of concentrate is of sufficient quality for producing 2 kg of milk, while roughages can meet the maintenance requirements. Because cross-breds have higher requirements for good quality feeds, and because they seem beneficial only if this ratio is lower than 1:1.25, assuming that little high quality fodders are available. In any case the demand for concentrate feeds is bound to increase with increase in the female crossbred population. With the increase in the total demand for milk products projected at 4.3 per cent per annum in the next two decades in India [Radhakrishnan 1991] there will be an induced demand for feeds as well as fodders.

The crossbreeding programme could not create the desired impact on dairy development because of various constraints such as lack of clear-cut breeding policy, implementation of crossbreeding programme irrespective of its applicability/suitability to the area, lack of AI and veterinary aid facilities, repeat breeding, ban on slaughter of cattle in almost all the states. Even the provision of AI facilities does not gaurantee the adoption of crossbreeding programme by the farmers as reported by Dhas (1991). McDowell (1984) opined that marginal to sub-marginal returns are a serious impediment to the adoption of breeding systems designed to increase genetic potential for milk yield. India is no exception to his contention that large AI programmes have been launched for crossbreeding without consideration of farmer priorities.

Conclusions

Crossbreeding technology helped in increasing the milk production though the extent of contribution of crossbreds to this is not clear and varies across India. Though the impact of crossbreeding programme on milk production is not as substantial as expected, there is no point in discontinuing it, rather it should be examined for its failure and success. It is unfortunate that much time and resources have been lost in the process of experimenting with crossbreeding in cattle to increase the genetic potential for milk production. It is high time for the planners and policy-makers to review the breeding policy and activities in the country with earnest consideration to the existing farming systems and farmer priorities.

The increased number of crossbreds induces an increased need for, especially high quality feeds, medicines and vaccines. Undesirable consequences of this crossbreeding technology are decrease in availability of draft animals, while in the process sturdy local cattle are getting replaced by comparatively more susceptible crossbreds, though at a slower pace.

Despite expending huge amounts of money on crossbreeding technology in addition to the supply of almost free of cost supply of

semen to the farming community, this technology has shown its impact only in a few farming systems, probably mainly due to differences in conditions in farming systems. For successful implementation of this controversial crossbreeding technology it is necessary to ascertain beforehand the conditions conducive for the technology. It is better to implement the crossbreeding programmes with vigour only in the potential promising areas rather than wasting resources in implementing the programme throughout the country. Important conditions influencing the successful implementation of crossbreeding include an increased demand for cow milk or young stock resulting in a remunerative market, low demand for draught animals, accessibility of veterinary assistance to farmers, and low prices of high quality feeds relative to milk prices.

Concept

NATIONAL INFORMATION SYSTEM IN EDUCATION

A Comparative Study

S.L. Verma

Hardbound Rs. 500

Since the focus of the book is on information system, it makes a detailed examination of the micronational library, public and academic libraries, the library and educational information networks. It also explains the concept, the design and functions of an information system to evolve a suitable model of National Information System for Education. The author makes a detailed analysis of the proposed model's objectives, planning and coordination, governance, financial aspect, and emphasises its suitability in the Indian context.

Dr. S.L. Verma is presently working as Deputy Librarian in the Department of Library, Documentation and Information, N.C.E.R.T., New Delhi.

Farmer Management of Public Tubewells in West Bengal

D S K Rao

West Bengal has a large number of state-owned tubewells, catering to the needs of the vast number of marginal and fragmented landholdings. However, their poor management resulted in erratic water supplies and eroded farmers' faith in the system. The government, therefore, decided to hand-over all the shallow tubewells constructed under the World Bank scheme to local panchayat samitis.

The democratic setup of the panchayati raj system was fully involved in the entire process from the allotment of tubewells to management of them. The study reveals that the overall performance of the tubewells was encouraging with the beneficiaries paying water charges on regular basis. However, delay in energisation and lack of adequate power supply during the peak requirement season led to some underutilisation of tubewells.

WEST BENGAL state is endowed with good groundwater potential, of which barely one-fifth has been tapped so far. This level of exploitation of groundwater resource is well below the national average of one-third, and much less than that of Punjab-Haryana region. This could be attributed mainly to the predominance of marginal and fragmented holdings on which individual wells and pumpsets are not a viable investment. Dhawan (1982) observed that the development of tubewell irrigation in the Gangetic plains diminishes when traced from western Uttar Pradesh to West Bengal. This trend, according to him, is on account of several factors, such as, progress in land consolidation, spread of rural electrification and institutional finance, besides the size of landholdings and their fragmentation in space. While no district in West Bengal suffers from over-exploitation of groundwater resource, Nadia and 24 Paraganas (N) districts attained a level of 56 per cent exploitation (*vide* Appendix Table 1).

In view of the above, the West Bengal government invested heavily in groundwater development and created irrigation facilities for small and marginal farmers through state-owned tubewells. Nearly 4,000 deep tubewells and 12,000 shallow tubewells were constructed during the last three decades. Water charges under these tubewells are kept at the level of highly subsidised canal water rates. In spite of low water rates, utilisation under the state tubewells has been extremely low. This could be attributed mainly to poor power supply and inefficient management. As a consequence, water supply under these tubewells is erratic causing the farmers to lose faith in the system. The officials of the minor irrigation department attribute the above dismal performance to lack of accountability. Each cluster of 12 government shallow tubewells is maintained by a single operator who is unable to give attention to the maintenance of any of the tubewells. Many of these tubewells are also lying idle because pumpsets are frequently stolen.

I
World Bank Scheme

In 1985-86, the West Bengal government launched a massive scheme for constructing dug wells, shallow tubewells, deep tubewells and river lift irrigation with World Bank assistance of US $ 99 million. Execution of work under the above scheme started in the year 1988-89 and was completed in March 1994. It was originally envisaged that these tubewells would also be under the management of the state minor irrigation department. However, the World Bank and the state government had their misgivings about the efficiency of management under the state sector and therefore decided to hand them over to panchayat samitis. Under the World Bank scheme shallow tubewells, low duty tubewells and medium and heavy duty tubewells were constructed depending upon the suitability of the hydrogeological conditions of a particular area, the design, cost and other parameters adopted for different structures are given in Table 1.

The average command area of a heavy duty tubewell is 40 hectares, which is twice that of a medium duty tubewell. In all, 1,200 heavy duty and 400 medium duty tubewells were constructed by September 1994. These tubewells are provided with pipe distribution system. Heavy duty tubewells have 15 outlets, each serving 2.5 hectares as compared to 10 outlets for the medium duty tubewells, each catering to 2 hectares.

Shallow tubewells and low duty tubewells have similar depth and discharge. However, in areas where water levels are shallow and drawdown is less, shallow tubewells are installed with centrifugal pumpsets. Low duty tubewells are essentially shallow tubewells, but installed with submersible pumpsets because of deep water levels. Altogether 5,583 shallow tubewells and 2,596 low duty tubewells were constructed by September 1994 as against the total target of 8,640 structures. Shallow/low duty tubewells are invariably constructed in clusters, shallow/low duty tubewells are invariably constructed in cluster of 5 to 7 structures. In view of the small command area (4 to 6 hectares), pipe conveyance is not provided and farmers are encouraged to construct field channels on their own.

In view of their small command area and easy management, all the shallow and low duty tubewells were to be handed over to the panchayat samitis. Medium and heavy duty tubewells continued under the management of the state government because their operation and maintenance demands skill and organisation. However, as an experiment, 2 to 3 deep tubewells per district were to be handed over to panchayat samitis.

Under the World Bank scheme, selection of tubwell sites and consequently, the beneficiaries, has been done involving the three tiers of panchayat raj system, viz, zilla parishad, panchayat samiti and gram panchayat. Initially, districtwise targets of tubewells were finalised at the state level by taking into consideration the potential for groundwater development, proportion of small and marginal farmers, etc. Sabhadhipati of the zilla parishad, in consultation with the site selection committee (SSC) distributed the tubewells allotted to the district to different panchayat samitis. The SSC includes two officials of the State Electricity Board, one geologist and one irrigation engineer besides one official from the agriculture department as members with the sabhadhipati as the chairman. At panchayat samiti level, the standing committee for agriculture, irrigation and co-operation further allotted the tubewells to the gram panchayat.

The concerned gram pradhans called a meeting of the elected village panchayat members and decided the villages in which the wells were to be located. Elected members of the village panchayats convened a meeting of all the villagers to discuss the siting of tubewells. While finalising the location of tubewells the following criteria were observed: (i) distance from the high tension line (the State Electricity Board releases priority electric connections to wells located within 1,500 metres from the high tension line), (ii) spacing between wells (minimum spacing of 200 metres is maintained between

two shallow/low duty tubewells as compared to 1,000 metres for medium/heavy duty tubewells), (iii) proportion of small and marginal farmers (at least 80 per cent of the beneficiaries under the tubewell have to be small and marginal farmers), (iv) scope for multiple cropping, and (v) willingness of the farmers to donate a piece of their land for constructing tubewells.

After finalising the location of tubewells, the village panchayat delineated the tentative command area of the cluster. An undertaking was obtained from the farmers willing to donate their land for tubewell construction. Another undertaking was obtained from all the farmers included in the command, to the effect that they would purchase water supplied by the panchayat tubewells. The village panchayat forwarded the above details to the gram panchayat, which in turn forwarded them to the panchayat samiti.

The Chart shows the involvement of the panchayat raj system in the process of tubewell allocation and site selection.

Though the above procedure is very elaborate and time consuming, it is probably the best way to ensure farmers' involvement in the planning process. Besides, it ensures commitment of the farmers to the tubewell management.

After tubewells were constructed and pumpsets energised, they were handed over by the minor irrigation department to the panchayat samitis which had the overall responsibility of running them. The most important function of the panchayat samiti is to constitute beneficiary committees for the operation and maintenance of tubewells besides fixing the water rates. The panchayat samitis also have the responsibility of maintaining the profit-loss account of individual tubewell clusters.

Day to day working of tubewells is looked after by the beneficiary committee, which generally includes a beneficiary representative of the panchayat samiti and of gram panchayat. All the tubewell operators are also members of the beneficiary committee.

The main function of the beneficiary committee is to ensure watch and ward of the tubewells, besides their operation and maintenance. The committee is also required to maintain proper records of tubewell running, water rates charged and the revenue realised.

II
Irrigation Management

The mounting costs of operation and maintenance of irrigation structures and lack of commensurate revenue from them due to extremely low water rates have prompted many governments the world over to transfer irrigation management to farmer groups. In India, the idea of farmer participation in irrigation management has grown since the last one decade. This idea has arisen from the need for better returns from the massive investments made in irrigation [Kanwar 1988].

West Bengal is the first state in the country where large-scale transfer of irrigation management has taken place during the last 3 to 4 years. Hundreds of tubewell clusters constructed under the World Bank scheme are handed over to panchayat samitis. It was decided to conduct a systematic study of the management of tubewells under the panchayat samitis in West Bengal and evaluate its success.

The main objective of the present study is to examine the quality of tubewell management by the panchayat samitis. To enable the author to draw meaningful conclusions on the above, the following aspects were studied in detail: (i) quality of design, construction and maintenance of tubewells, (ii) utilisation of tubewells, (iii) role of panchayat samiti and the beneficiary committee in tubewell management, and (iv) attitude, response and involvement of farmers in tubewell management.

The present study focused mainly on the management of shallow/low duty tubewell clusters because large-scale transfer of these has taken place as compared to deep tubewells (Table 2). Under the World Bank scheme shallow/low duty tubewells were constructed in 16 districts. However, only Nadia and Hooghly districts were selected for the present study because of high concentration of shallow tubewells and low duty tubewells respectively in the above two districts. Besides, transfer of tubewells to panchayat samitis has also taken place more vigorously in these two districts. Two blocks were selected in Hooghly (Singur and Chaunditala II) and Nadia (Haringhata and Ranaghat II) districts. Five tubewell clusters (Jonai, Baksa and Babur beri in Hooghly district and Dhauntala and Parmajdia in Nadia district) and 40 beneficiary farmers were selected on a random basis for the study.

Data collected from the tubewell clusters included information on tubewells (design, yield, command area and utilisation of the structures) and particulars of the farmers (land owned, cropping pattern, crop yield, and net income before and after the construction of tubewells), perception of the beneficiaries on the adequacy, timeliness and equity of water supplied was also obtained.

Hooghly and Nadia districts have high proportion of the geographical area under cultivation (81 and 72 per cent, respectively). Both the districts are characterised by high rainfall (1,500 mm), 80 per cent of which occurs between June and October. The area has fertile Gangetic alluvial soils. Rice, jute, wheat, mustard, pulses, potato and vegetables are the major crops. Groundwater and canals are the major sources of irrigation in Hooghly district, whereas Nadia district is irrigated mainly through groundwater. Heavy dependence on groundwater for irrigation has led to high stage of groundwater development in Nadia district (Table 3).

III
Design, Construction and Utilisation of Tubewells

In designing the tubewell assembly it is essential to determine the length of the housing pipe carefully because inadequate length may reduce the life of the tubewell whereas longer pipe than necessary will enhance the cost without increasing the yield. Optimum length of the housing pipe under the World Bank tubewells was determined after taking into consideration the depth to water level, drawdown and water level trends. A case in point is the two tubewells in Baksa cluster, where inadequate housing pipe has resulted in decline of discharge, particularly in the late 'rabi' and 'boro' seasons. In such situation the only solution is redrilling of tubewells and providing deeper housing pipes.

The shallow/low duty tubewells studied in the field were developed by both compressor and pump for adequate duration. Discussion with the engineers also revealed that selection

TABLE 1: TYPICAL DESIGN, COST AND COMMAND AREA OF DIFFERENT STRUCTURES UNDER THE WORLD BANK SCHEME

Type of Tubewell	Cost (Rs Lakh Per Tubewell)	Command Area Per Tubewell (ha)	Minimum Spacing (m)	Design Parameters
Heavy duty tubewell	8.0	40	1000	150 m depth, 56 litres per second discharge PVC pipe distribution.
Medium duty tubewell	5.6	20	1000	150 m depth, 28 litres per second discharge PVC pipe distribution
Low duty tubewell	1.2	4.6	200	60 m depth, 8 litres per second discharge (installed with submersible pumpset)
Shallow tubewell	0.85	4.6	200	60 m depth, 8 litres per second discharge (installed with centrifugal pumpset)

Source: Office of the Chief Engineer, Minor Irrigation Department, West Bengal.

of slot size for the strainer and the gravel was made after careful analysis of the granular samples. The study showed that with the exception of two tubewells in Baksa cluster, tubewell designing in general has been made in a scientific manner.

Drilling of tubewells was generally completed within about one month for a cluster of six tubewells. Deep tubewells were drilled by the minor irrigation department using rotary/reverse rigs. Shallow and low duty tubewells were drilled by private contractors using hand boring sets. Though tubewell construction was completed at brisk pace, there was considerable delay in the energisation. Under the World Bank scheme, 8,179 shallow/low duty tubewells were drilled and developed by September 1994 but hardly 2,640 were energised because of slow release of electric connections by the electricity board. Energisation took about two years after the tubewell construction (Table 4) which resulted in enormous loss of production.

Energisation delay was compounded by delay in commissioning of tubewells. This was inevitable because constitution of beneficiary committee took 3 to 4 months. All the tubewells in a cluster are interconnected so that if any structure is out of order, its command area is covered by operating the other tubewells for longer duration. In Baksa cluster, to compensate for the reduced discharge of two tubewells, the remaining ones are operated for longer duration. However, this arrangement is not fully satisfactory because of poor power supply during the peak season.

Soon after tubewell construction is completed, pending commissioning, the structure is protected by covering with a metallic plate. Under the Dhauntala cluster one tubewell was not properly covered and the villagers choked it by dumping trash and stones into it. This resulted in permanent damage to the structure. In the same cluster one motor remained out of order for more than two years. The third tubewell has recorded reduced discharge in the summer season because of decline in water levels. Five tubewells out of thirty studied have developed problems in a short span of 3-4 years. Unless repairs are promptly attended to the problem is going to be severe in the future.

Though the government envisaged that shallow tubewells would run for about 1,600 hours per annum, in actual practice, most of them worked for lesser period (Table 5). Average annual running for the four clusters for which data is available worked out to 878 hours per tubewell. The above underutilisation was because of poor design (Baksa) and maintenance (Dhauntala). The other major reason for underutilisation is the inadequate availability of power during the peak requirement season. However, performance of the above panchayat tubewells is far superior to government tubewell cluster. This is reflected in Dhauntala and Ranaghat II panchayat samitis wherein tubewells under government clusters averaged less than 100 hours per annum.

IV
Panchayat Samiti Management

Successful management of tubewells depends to a great extent on the involvement of the panchayat samiti, beneficiary committee and the tubewell operators. An attempt has been made to evaluate their performance in relation to tubewell clusters studied in the field.

Panchayat samitis are given considerable autonomy in the management of tubewells. However, in respect of the five tubewell clusters and one heavy duty tubewell studied, role of the panchayat samiti did not go beyond the constitution of beneficiary committees and appointment of operators. Sustained efforts to monitor the tubewells and take prompt corrective measures were lacking. Panchayat smitis have neither maintained the accouns of tubewell clusters nor made efforts to improve the accounting system of the tubewell operators. Excess reliance on tubewell operators for collecting water charges, besides maintaining accounts and registers, with lax supervision may lead to unwarranted practices

CHART . PROCESS OF TUBEWELL ALLOCATION AND SITE SELECTION

Secretary, Irrigation
Chief Engineer, Minor Irrigation

Districtwise allocation of tubewells

(Chief Engineer obtained the approval of the government and ordered the concerned executive engineers to take up the work)

Zilla Parishad

(Sabhadhipati, in consultation with the site selection committee, allotted tubewells to panchayat samitis)

Zilla Parishad

(District site selection committee further discussed the suitability of tubewell sites)

Panchayat Samiti

(Sabhapati, in consultation with the standing committee on agriculture, irrigation and co-operation allotted tubewells to gram panchayats)

Panchayat Samiti

(Verified if all the norms, such as spacing, distance from the HT line, proportion of small and marginal farmers and scope for multiple cropping pattern were followed)

Gram Panchayat

(Pradhan, in consultation with the elected members of the village panchayats, selected the villages in which tubewells could be located)

Gram Panchayat

Forwards the recommendations of the village panchayat to the panchayat samiti

Village Panchayat

(Elected member of the village panchayat convened a meeting of all the villagers and decided the location of tubewells.)

Village Panchayat

(Tentative command delineated. Undertaking obtained from farmers willing to donate a piece of land for tubewells. Undertaking from all the beneficiaries that they would purchase water from the panchayat tubewells).

TABLE 2 PHYSICAL PROGRAMME OF VARIOUS GROUNDWATER STRUCTURES UNDER THE WORLD BANK SCHEME

Type of Tubewell	Status of Tubewell Construction (September 94)				
	Target	Selection of Sites	Constructed	Energised	Wells Handed Over to Panchayat Samitis
	(no)	(no)	(no)	(no)	(no)
Heavy duty tubewell (HDTW)	1205	1047	1020	683	6
Medium duty tubewell (MDTW)	510	500	426	207	2
Low duty tubewell (LDTW)	2940	2674	2596	945	812
Shallow tubewell (STW)	5700	5672	5583	1695	1184

Source: Office of the Chief Engineer, Minor Irrigation Department, West Bengal.

Beneficiary committees have the direct responsibility of tubewell mangement. Though the state government had decided that the beneficiary committee shall consist of 7 to 8 members, all the 5 tubewell clusters studied had larger committees, with membership ranging from 10 (Parmajdia cluster) to 13 (Jonai cluster). It is significant to note that the beneficiary committee of Parmajidia cluster, which is comparatively small and compact, is working efficiently. Unlike the remaining four clusters, beneficiary committee meetings of Parmajdia are held regularly, with minutes recorded properly and follow-up action initiated promptly.

In all the clusters studied, tubewell operators are beneficiary farmers who are members of the beneficiary committee. They are generally marginal farmers whose land under the tubewells ranged from 0.1 to 0.6 hectares. It is noteworthy that no special favour or representation is given to large farmers in the committee. The convenor of the beneficiary committee is either a beneficiary farmer (Jonai heavy duty tubewell) or tubewell operator (Dhauntala cluster) or an employee of the panchayat samiti (Babur beri, Baksa, Jonai and Parmajdia clusters) as decided by the sabhapati. The government had envisaged an active role to the convenor in the managerial functions. However, in practice, convenors were generally passive with the operators managing the tubewells

All the beneficiary committees have done well in the watch and ward of the tubewells. No theft of pumpsets or their accessories was reported from any of the tubewells. In comparison, government managed tubewells have fared badly. Theft and pilferage have rendered many government tubewells infructuous (personal communication, chief engineer, minor irrigation department). Yet, it is unfortunate that none of the beneficiary committees has acted with a vision: they have not looked beyond the watch and ward of and operation of tubewells The committees have neither rectified the existing sick tubewells nor built up resources to replace the pumpsets and tubewells after their economic life (pumpset has an economic life of 9 years as compared to 25 years of a tubewell: however tubewells may need replacement much earlier if their design is not proper).

Role of Tubewell Operators

The number of operators under tubewell clusters is varying. Parmajdia cluster is looked after by two operators. Dhauntala, Jonai, Baksa and Babur beri clusters have six operators, one for each tubewell. For the shallow tubewell clusters, operators are invariably those farmers who have donated a piece of their land for the construction of tubewell. Operators of Jonai, Baksa and Babur beri clusters receive a monthly salary of Rs 200 to 250, as compared to commission of Re 1 per hour of tubewell operation under Dhauntala cluster. Only under Parmajdia cluster, operators are not paid salary and are expected to work voluntarily.

It is observed that operators have, in general, relatively higher education levels. Out of 26 operators working on the 5 clusters, 15 are matriculates. A few among them have also undergone training in pump maintenance. The operator of Jonai heavy duty tubewell is a ITI trained pump technician. He is a full time employee (not a beneficiary farmer) and receives monthly compensation of Rs 1,000.

In the tubewell clusters studied, operators are performing the following duties: (i) operate pumps and allocate water to farmers, (ii) supply water to farmers outside the command when surplus capacity is available, (iii) maintain individual registers for farmers and tubewells, recording the number of hours tubewells run, crops grown, area covered, and (iv) prepare individual bills and collect water charges.

It may be seen that the operators have wide range of duties. Collection of water charges and maintenance of accounts can be taken over by the convenor of the beneficiary committee so that operators are left free to run the tubewells and maintain the records.

Cropping Pattern and Farm Income

Out of the 40 farmers interviewed under the five clusters, 36 (90 per cent) are small and marginal farmers with landholding less than 2 hectares. Farmers owning less than 1 hectare amount to 73 per cent. Thus, the tubewell clusters are catering predominantly to marginal farmers, who were depending on unirrigated farming or purchasing water from neighbouring farmers at exorbitant rates before commissioning of the panchayat samiti tubewells.

Before joining the tubewell cluster the cropping pattern adopted by the farmers was rainfed paddy or jute during the kharif and pulses in the rabi season. Wherever scope existed for purchase of water, farmers cultivated groundnut or other oilseeds. With the introduction of tubewells, cropping pattern shifted in favour of irrigated paddy during the kharif and boro seasons. Boro paddy is the most popular crop in the study area because of higher yields and better returns.

In view of the erratic nature of monsoon, yields of rainfed kharif paddy and jute were low and averaged 1,200 and 500 kgs/ha, respectively. With the introduction of tubewell irrigation, kharif paddy yield increased to 2,500 kgs/ha. Boro paddy yields are as high as 4,600 kgs/ha. The net income under tubewell cluster was, on average Rs 14,000 per hectare for the two crops of kharif and boro paddy. Many farmers are also deriving good income by cultivating potato and other vegetables during the rabi season. The vegetable crops, under irrigated conditions are yielding a net income of Rs 12,500 per hectare. The post-development cropping pattern under tubewells is remunerative. With high cropping intensity (minimum of 200 per cent) and the benefit of assured irrigation, farmers are deriving good income.

Water Charges and Cost Recovery

In all the tubewell clusters studied the water rates were fixed after discussing the issue in a general body meeting of the beneficiary farmers. Jonai, Babur beri and Baksa clusters have fixed annual water rates on area basis (Rs 1,125 to Rs 2,000 per hectare), whereas Parmajdia and Dhauntala clusters follow hourly basis @Rs 5 per hour).

Under both area and time norms, water rates work out to be nearly the same. As the tubewell discharge is about 7 litres per second, for water rate of Rs 5 per hour, the cost of one cubic metre water worked out to Rs 0.20. Even for water rates of Rs 2,000/hectare/year the cost of one cubic metre of water worked out Rs 0.20 (assuming that farmers purchase about one hectare-metre water in a year amounting to 10,000 cubic metres for an area of 1 hectare). Jonai cluster is charging substantially lower rates because of light

Table 3: Details of Groundwater Development in the Study Area (as on September 1994)

District/ Block	Groundwater Balance (Hectare Metres)	Stage of Groundwater Development (Per Cent)
Hooghly	87225	32
Chaunditala II	2115	25
Singur	6879	30
Nadia	74511	56
Ranaghat II	3278	72
Haringhata	1534	78

Table 4: Delay in Energisation of Tubewells in the Study Area

Name of the Tubewell Cluster	Date of Tubewell Construction	Date of Energisation
Babur beri	February 1990	August 1992
Jonai	February 1991	December 1992
Jonai (HDTW)	June 1990	February 1993
Baksa	February 1990	August 1992
Paramajdia	January 1990	September 1991
Dhauntala	January 1990	August 1991

Source: Office of the Executive Engineer, Minor Irrigation Department, Hooghly and Nadia Districts.

Table 5: Utilisation of Shallow/ Low Duty Tubewells

Name of the Tubewell Cluster	Average Annual Running Hours Per Tubewell
Baksa	1085
Babur beri	1160
Dhauntala	289
Parmajdia	1098

Source: Office of Executive Engineer, Minor Irrigation Department, Hooghly and Nadia Districts.

irrigated crops cultivated by the farmers.

In Nadia and Hooghly districts, farmers without irrigation facilities purchase water from neighbouring farmers at Rs 12 per hour (Rs 20 per hour if tubewells are operated by diesel engines). For tubewell discharge of 7 litres per second the charges work out to Rs 0.48 per cubic metre (Rs 0.79 per cubic metre in case of diesel engines) which are much higher than Rs 0.20 per cubic metre paid by panchayat tubewell beneficiaries.

It is noteworthy that in all the tubewell clusters visited (including the Jonai heavy duty tubewell) there was no problem of collection of water charges. Farmers are billed two to three times a year, at the end of each crop season and the payment of water charges by farmers is very encouraging. In hardly about 10 per cent of the cases payment is deferred to the next crop season, but none of the farmers has defaulted beyond that.

Though four out of the five tubewell clusters have generated surplus, their financial position is not sound. Unless panchayat smitis manage funds efficiently, they will not be able to meet the cost of tubewell maintenance from the revenue earned from the tubewells. The Dhauntala cluster is in a precarious position, with the expenditure far exceeding the income. The income is low because two tubewells are out of order and the remaining four could not be run for longer duration because of short supply of power of adequate voltage during the peak season. Though tubewells were not utilised optimally, the electricity bills had to be paid fully, on a flat rate, which is a drain on the meagre income of the cluster. It will be more beneficial for this cluster to pay the electricity charges on meter basis

However, the cluster has reduced the operation cost substantially by paying the salary of the operators on commission basis (Re 1 per hour of tubewell operation). Jonai cluster is characterised by light irrigated crops. Hence, the water rate is only Rs 1,125 per hectare, which is far less than Rs 2,000 per hectare charged under the nearby Babur beri and Baksa clusters. At the same time, the tubewell operators are paid salary of Rs 200 per month. Electricity charges are also paid on a flat rate. It will be prudent to pay salary to the operators on commission basis, as in the case of Dhauntala cluster. As all the tubewells under this cluster are yielding uniformly good discharge of 6 to 7 litres per second, there is need to promote irrigation intensive crops, such as, vegetables which will not only utilise the available water potential of the tubewells but also enhance farmers' income substantially, enabling them to pay higher water charges.

The position of Babur beri, Baksa and Parmajdia clusters is comparatively better. They have generated surplus income, ranging from Rs 19,800 to 21,700 per year (Table 6). It is natural that in the initial years such surplus is generated because the structures are new and there is hardly any cost in the maintenance of tubewells and pumpsets. However, considerable expenditure will be involved after a few years when the pumpsets are to be replaced and the tubewells are to be redrilled existing surplus will not be able to meet such expenditure. None of the panchayat samitis has given any serious thought to the above situation.

The author strongly feels that those tubewell clusters having surplus income must invest their profits prudently. If investments are made in fixed deposits or Indira Vikas Patras or any other scheme, there will be regular flow of enhanced income after 5 to 6 years, which will be useful in meeting the maintenance demands arising out of the older pumpsets and tubewells. All the sabhapatis with whom the author discussed, appreciated the above point and assured that they would consider investing the income generated from the tubewells.

Discussions with the beneficiary farmers also revealed that they were willing to pay higher water charges, up to Rs 8 per hour of tubewell operation, if the profit generated from the tubewells is invested properly. It may be noted that at present farmers who do not have access to irrigation are paying Rs 12 to Rs 20 per hour for purchasing water from private shallow tubewell owners.

Management Transfer: Degree of Success

Some of the key parameters to evaluate the quality of tubewell management by the panchayats are: (i) participation of farmers, (ii) distribution of water, and (iii) realisation of water charges. Analysis of data collected from the five tubewell clusters and one heavy duty tubewell, besides 40 beneficiary farmers on the above aspects is presented below.

Farmers participated actively in the selection of tubewell sites. Selection was made in an open meeting of all the villagers after thorough deliberations on the norms, such as, minimum spacing, distance from the high tension line, composition of small and marginal farmers, etc. The entire process was transparent and ensured fair selection. Soon after the beneficiary committee was constituted, the issue of water charges was discussed in a general body meeting of the beneficiaries. The water charges levied by the panchayats was thus a collective decision and the beneficiaries were committed to it. However, farmers had no say in the design of tubewells and pumpsets and the alignment of irrigation channels. These decisions were taken, correctly so, by the engineering department on technical considerations.

Quality of water distribution could be judged from the angle of equity, reliability, efficiency and sustainability of the supply.

Equity: Analysis of the data on water charges paid by the farmers and discussions with a cross-section of them brought out clearly that water supplied was directly proportional to the land owned by them under the tubewell cluster. Caste and status of the farmers had no influence on the quantum of water supply. A notable feature is that equity is ensured between the head and tail-end farmers. This is achieved by supplying water for proportionately longer duration to fields away from the tubewells to compensate for seepage losses, at no extra cost.

Reliability: Under Jonai, Babur beri and Parmajdia clusters, the requirement of all the beneficiaries, even during the peak period, are being met. The dischare of the heavy duty tubewell in Jonai was also found to be adequate to meet the peak requirements of all the farmers. However, Baksa cluster is facing problem during the late rabi and boro seasons because of decline in water levels and consequently the discharge in respect of two tubewells. Under Dhauntala cluster also reliability of supply is affected because of damage to one tubewell and one pumpset.

Efficiency: The cost of tubewell operation includes expenditure on slary of the operators, electricity charges and repairs to pumps. There is scope for reduction in the tubewell operation cost. Instead of engaging six operators, paying Rs 200 to 250 per month to each of them, the panchayat could employ two operators, each looking after 3 tubewells, for a monthly salary of about Rs 400. Two operators of Parmajdia cluster are able to manage all the six tubewells successfully and efficiently. Economy could also be effected by switching over to metered electricity charges, wherever tubewell utilisation is poor as in the case of Dhauntala cluster in which tubewells are running on average for only 289 hours per annum. For such tubewells, instead of flat rate of Rs 1,800 per annum (@ Rs 50/BHP/year for 3 HP motors), they could pay metered tariff which works out to only Rs 420 (for power tariff of Rs 0.55 per Kwh and motor efficiency of 85 per cent) per annum. Efficiency and equity could also

TABLE 6: ANNUAL EXPENDITURE AND REVENUE UNDER TUBEWELL CLUSTERS

Tubewell Cluster	Net Area Commended (ha)	Water Rate (Rs ha)	Water Charges Collected Per Year (Average for the Period 1992-94)	Operation Cost Per Year (average for the Period 1992-94)
Jonai	24.3	1125	27338	26400
Babur beri	26.0	2000	46173	29988
Baksa	27.7	2000	55400	33700
Parmajdia	36.6	Rs 5 /hour	32940	12000
Dhauntala	36.7	Rs 5 /hour	8670	13000

be improved by providing pipe conveyance and distribution under tubewells.

Sustainability: Sustainability was found to be affected by two factors, viz, declining groundwater levels and lack of resources to replace the sick tubewells/pumpsets. In respect of water levels declining below the housing pipe, there is no alternative than redrilling and providing deeper housing pipes. Expenditure on such remedial measure will be almost equal to the cost of a new tubewell. Though the above problem is existing for more than two years, the Baksa panchayat samiti has not taken any action. It also took more than two years to get one motor under the Dhauntala cluster repaired. Unless adequate resources are built up, proper maintenance and sustainability in supplies cannot be assured.

It was observed that farmers were satisfied with the water supply on all counts (in the questionnaire, farmers' perception was rated on a four-point scale of very good, good, satisfactory and poor regarding equity, reliability and sustainability of water supply). Nearly 75 per cent of the farmers responded with good and very good for the above three parameters. The exceptions were in Baksa and Dhauntala clusters, where farmers were demanding more water for the boro paddy.

Role of Credit

Though the state minor irrigation department has transferred the tubewells, complete in all respects, to the panchayat samitis, there is scope for further investments to improve the efficiency and sustainability of tubewell irrigation.

A cluster has, on avearage, six tubewells which are operated by six pumpsets. If any one pumpset is out of order during the peak requirement season, the entire schedule of water supply goes awry. This problem is more for submersible pumpsets because repairs to them is a time consuming process as compared to centrifugal pumpsets. One spare pumpset for each cluster, as a standby, is essential which can be covered under institutional credit.

Institutional credit could also be extended to pipe conveyance and distribution. At present the entire distribution is through unlined channels. If the channels are replaced with underground pipeline, about 5 per cent of the area which is presently lost to channels and about 20 per cent of seepage losses could be saved. Investment on pipeline is thoroughly viable and will also help more equitable distribution of water between the head and tail-end farmers. Bank loan could also be useful for redrilling damaged tubewells and redevelopment of sick tubewells. In Dhauntale and Baksa clusters, altogether three tubewells need to be redrilled for which bank loan could be extended.

At present, farmers under tubewell clusters are only members of informal groups. The informal group could be registered as a society and bank loan given to the society or alternatively, banks could finance individual farmers, providing loan in proportion to the land owned by them under the cluster. In respect of individual loans, the number of loan accounts will be very large because of the predominance of marginal farmers. Financing a society may be a better option to the banks.

VI
Conclusions

Despite good groundwater potential in many districts, West Bengal state has not been able to achieve a breakthrough in private investments on wells and pumpsets. This is mainly because of the predominance of marginal and fragmented landholdings on which private wells and pumpsets are not viable investments. To overcome the above situation the state government and managed large number of tubewells catering to groups of marginal farmers. However, poor management has led to gross underutilisation of these structures imposing heavy financial burden on the state government. The state government, therefore, decided to hand-over all the shallow tubewells and a few deep tubewells constructed under the World Bank scheme to panchayat samitis for their management.

Thoroughly democratic process, involving the well established panchayati raj system in the state was followed in the distribution of tubewells to different districts, blocks and villages. Involvement of farmers was ensured in the selection of tubewell sites and fixation of water rates. Design of tubewells and pumpsets was done by the engineering department and was in order excepting Baksa cluster where in respect of two tubewells housing pipe should have been longer. Inadequate power supply has resulted in the underutilisation of a few tubewells.

Farmers are prompt in paying the water charges. Overdues and defaulting farmers are rare. Farmers are not unwilling to pay higher water rates, say Rs 8 per hour, 60 per cent more than the existing Rs 5 per hour if adequacy and reliability of irrigation supply are improved. Tubewell clusters charging water rates on area basis may also switch over to hourly rates, which is bound to improve water use efficiency.

Institutional credit can play an important role in improving the efficiency and reliability of water supply. Panchayat samitis and beneficiary committees are not acting with a vision. Long-term planning to raise resources for the replacement of tubewells and pumpsets after their economic life is not being made. If panchayat samitis take more interest and monitor the performance of the beneficiary committees closely it would be possible to sustain and expand tubewell irrigation under their management.

Who Borrows? Who Lends?

Changing Structure of Informal Credit in Rural Haryana

Surinder S Jodhka

Much of the literature on 'rural credit' in the post-independence period has been centred around the 'development questions' and is largely quantitative in nature. Based on a qualitative field study in three villages of a green revolution district of Haryana, this paper attempts to explore the sociology of informal credit with a specific focus on understanding the changing structure of informal credit market and the emerging patterns of debt dependencies in the light of (a) the agrarian transformation experienced with the success of the green revolution; and (b) increasing availability and growing popularity of the institutional sources of credit.

> The class struggle of the ancient world took the form chiefly of a contest between debtors and creditors which in Rome ended in the ruin of the plebian debtors... In the middle ages, the contest ended with the ruin of feudal debtors, who lost their political power together with the economic basis on which it was established [Marx 1954:135].

THE crucial mediating role that debt and credit play in the reproduction of dependency relationships in 'pre-capitalist' agrarian structures is a widely recognised fact. Apart from the historical literature on economic changes during the colonial period of Indian history, this aspect of rural society has been well-documented by the official agencies and the economists studying agrarian change during the post-independence period. In the historical literature on subjects like commercialisation of agriculture, land alienation and peasant discontent and mobilisation, questions of changing credit relations and growing debt dependencies of the small peasants, tenants and landless labourers have been discussed at great length.[1] Even in the theoretical formulations of the agrarian social structures, such as, 'patron-client' reciprocal relationships [Srinivas 1955; Breman 1974], 'interlocking' of agricultural markets [Bhardwaj 1974; Bardhan 1984; Bhaduri 1984; Srivastava 1989; Sarap 1991], or the 'semi-feudal' mode of production [Prasad 1974; Bhaduri 1984], the nature of debt related dependencies are considered to be the defining features of such relationships. Debt is supposed to play an important role in sustaining and reproducing these 'traditional' structures.

However, unlike the historical literature or conceptual frameworks of the 'pre-capitalist' agrarian structures, much of the literature on 'rural credit' in post-independence India has been centred around the 'development questions' and is largely quantitative in nature [RBI Reports 1969; Thorner 1964; Karkal 1962; Hough 1966; Huchappi 1968; Jodha 1971; Basu 1979; Wadhwa 1980; Roth 1983; Sarap 1991]. Most of the studies and surveys have focused on questions such as demand and supply of various forms of credit, the shift from informal to institutional sources of credit, extent and nature of indebtedness of various categories of rural society, performance of institutional sources of credit or determinants of interest rates in the informal credit market. While such quantitative data help us in understanding the economic aspects of agarian changes in contemporary India, it does not view the informal credit market or institutional credit as a network of social relationships. Also, it says very little about the impact that the changes in the structure of credit markets might have had on the institutionalised relationships of dependency and inequality referred to so frequently in the historical literature on rural credit.

However, even though 'credit' has been predominantly studied as an 'economic fact', there are some economists who have tried to argue that the relations of credit are more than purely economic phenomena. Bhaduri, for example, views 'forced commercialisation' and 'distressed sale' in backward agriculture, caused by credit dependencies of small peasants, as "a system of relations that are essentially social rather than technical in nature" [Bhaduri 1984:51]. Similarly Bhardwaj discussing the structure of backward agrarian economy argues,

> The character of markets reflect and to a significant extent is determined by the local patterns of power .. The relative bargaining strength (reinforced by forces of tradition, custom, social mores) determines access to resources, the terms on which they can be obtained and fields of feasible choices open to the individual in the various markets [Bhardwaj 1982:27].

Some of the studies and surveys on rural indebtedness carried out by individual economists and by official agencies have also been sensitive to sociological questions. The question of differential availability of institutional credit to the different strata of agrarian society and the crucial role that it plays in perpetuating relations of domination and exploitation, has been a central concern for many studies [Rudra 1975; Platteau et al 1980; Bandyopadhyay 1984; Sarap 1991; RBI Survey Reports 1969].

For sociological studies on rural society and agrarian change, the questions of credit and debt have at best been of a marginal concern. With the exception of a few studies [Malamoud 1983], references to credit and debt are made only in passing, usually as an aspect of a social process being studied, such as, patron-client relationships [Srinivas 1955; Epstein 1962] village economy [Beteille 1969], factional politics [Lewis 1958], production relations [Gough 1955 and 1960; Breman 1974; Brass 1990] or peasant discontent and mobilisations [Desai 1979; Dhanagare 1983].

II
Introduction

Based on a field study of three villages selected from a green revolution district (Karnal) of Haryana state,[2] this paper attempts to explore the sociology of informal credit with a particular focus on understanding the changing structure of the informal credit market and the emerging patterns of debt dependencies in light of (a) the agrarian transformation experienced with the success of the green revolution; and (b) increasing availability and growing popularity of the institutional sources of credit.

The specific questions that the paper attempts to deal with are (i) what kind of changes have come about in the structure of informal credit market during the post-independence period, specifically after the green revolution?; (ii) what happened to the traditional moneylenders and how have their relations changed with other caste groups in rural Haryana?; (iii) who borrowed from whom and for what kinds of needs in the informal credit market?; (iv) what is the nature and extent of indebtedness of the various categories of the agrarian society to institutional and informal sources of credit; and finally (v) how did credit mediate and institutionalise relations among various categories of the rural society specifically in the sphere of production and local power structure?

III
Agrarian Structure and Credit Relations in Study Villages

As in the rest of Haryana, economy in the study villages during the colonial period was backward and subsistence-oriented. Productivity of land was low and mostly a single crop was grown. Most of the land was owned by the middle level caste groups such as jats, rors and gujjars. The bigger landowners leased out part of their land to 'low caste' landless tenants. A tenant received two-thirds to one-half share of the yield. 'Sajhis', the attached labourers, who received one-fourth or one-fifth share were generally employed by the bigger landowners. 'Jajmani' type of relations also existed where 'kamins' worked for their jajmans and received payment according to the norms of the caste system.

A network of credit relations was the life-line of this system. It was locaiy known as 'sahi-sammi' system. Sah or 'shahukar' was the professional moneylender who belonged to the 'bania' caste. The sammi (meaning a client) was the peasant. Every peasant, including the big landowners, had a shahukar who was the source of credit throughout the year. The peasants needed credit for payment of land revenue, at the time of weddings or some other functions in the family, for visiting the nearby village or town, and at times, even for consumption

The landless menials who worked as labourers or sharecroppers had an indirect relationship with the bania or the sah. The bania did not lend them directly unless they offered some collateral security which they rarely had. So, most of them had their accounts along with the account of a landowning peasant with whom they worked as attached labourer or tenant or promised to work for at the time of harvesting. Some of the tenants, particularly those from upper castes and with substantial holdings, also had direct access to the bania. Those menials who worked as kamins, i e, performed their caste occupations, depended on the jajman for their credit needs while the jajman himself might borrow from bania.

Banias supplied almost all the commodities required by their sammis. Even at the time of weddings and other social functions, it was the sah who arranged all the provisions and cash required for the function or for the dowry. The obvious source of recovery of his loans was the peasant's yield from the land. In fact it was a customary duty of the banias to scale the entire yield of the peasants They were perhaps the only people in the village who knew elementary mathematics and could do the scaling. After distributing the respective shares to tenants, sajhis and kamins, they themselves took away a substantial part of the yield in order to clear-off their accounts. And if there was still some surplus left, over and above the consumption requirements of the peasant's family, it was generally purchased by them. At times the banias did not leave enough for the consumption requirements of the peasant. This happened particularly with the smaller peasants whose standing debts often exceeded the surplus produced on land.

Peasants also sold ghee (clarified butter) to the banias. Since most of the peasants kept buffaloes and milk was rarely sold, the peasants made ghee out of the surplus milk and sold it to the bania who generally sold it in the town. At times banias took away the cattle in order to clear off the debts. Also, there were cases of land mortgages to the banias – a phenomenon extensively reported in the literature on agrarian change during the colonial period. In village-I a bania had even bought 12 acres of land.

The interest rate charged by the banias was not very high. All the aged respondents belonged to different social groups reported that they charged a monthly interest of one paisa for a rupee (64 paise added up to a rupee). Following Marx's distinction between the usurer and merchant moneylenders [Marx 1971], one can say that the object of the bania merchant-moneylender was not to earn interest as such, "but to control prices of purchase and sale, and ensure regular channels for the supply and disposal of commodities. Since rural traders could not always determine the price at which they sold their stocks to wholesalers in 'mandis', they attempted to exercise their control at the point of supply in the village" [Bhattacharya 1985:307].

Apart from the banias, there were some big landowners who lent money, usually against a collateral security or by mortgaging in land. They were usually those who owned big holdings and generally gave their land to tenants for cultivation. They also lent to their tenants and labourers with the objective of tying them. They generally charged higher interest rates compared to the banias. The other terms of their credit were also more stringent.

Along with the big landowners, the banias enjoyed a position of power in the village society which has been slowly eroded during the last four or five decades. The perpetual indebtedness of the majority of the peasants gave them a position of authority that could not be easily questioned. They rarely needed to use any coercive methods to recover their loans. However, the relations between banias and the peasants were often marked by tensions and mistrust. They were seen as exploiters and cheats by the peasants. The banias reported that their houses were often robbed by the local gujjars.

Along with the sahi-sammi system, another customary practice relevant here, was the 'neota' system. A wedding in a family is an occasion where a considerable amount of cash is required. Neota was a communal arrangement to meet the expenses on weddings and it functioned within the extended kinship network locally known as 'biradari'. The neotis were generally from within the caste of a person but the network of neotis, transcended village boundaries. All the biradari members were invited at the time of a wedding and it was obligatory for every member of the biradari to give some amount in cash to the host family. This payment of money was called the neota. The records of neotas received and paid was maintained by both the parties. The neota amount would be paid back, generally with an additional sum, when the other family had a wedding to celebrate. Even where one could not attend the wedding, it was considered obligatory to send neota through some other villager who was going to attend the wedding. In most of the weddings, particularly among the menial castes, the amount received as neota used to be enough

TABLE 1: AVERAGE STANDING DEBT OF VARIOUS CATEGORIES OF RESPONDENTS TO INSTITUTIONAL AND INFORMAL SOURCES

Category	Village-I		Village-II		Village-III		Combined

Middle farmers (5-10 acres)	9,000 (65.2)	4,800 (34.8)	18,625 (84.5)	3,375 (15.5)	9,667 (70.2)	4,111 (29.8)	12,773 (76.2)	4,000 (23.80	16,773 (100)
Big farmers (10-25 acres)	6,833 (62.6)	4,084 (37.4)	18,583 (82.3)	4,000 (17.7)	21,857 (73.9)	7,714 (26.1)	14,774 (75.2)	4,871 (24.8)	19,645 (100)
Very big farmers (more than 25 acres)	9,000 (93.1)	667 (6.9)	26,000 (87.2)	3,383 (12.8)	12,500 (87.0)	1,875 (13.0)	15,500 (88.1)	2,100 (11.9)	17,600 (100)
All categories together	4,087 (51.95)	3,781 (48.05)	9,207 (66.55)	4,628 (33.45)	6,790 (59.77)	4,570 (40.23)	6,745 (60.9)	4,323 (39.1)	11,068 (100)

to cover nearly all the expenses of the wedding.

A related system of credit that existed along with the neota-system was the 'bisi-ikkisi' system. While the neota was received at the time of the marriage, the expenses on dowry and the wedding had to be made in advance. Under the bisi-ikkisi system, a bania shahukar or a landlord financed the entire wedding and, after the wedding, for every Rs 20 ('bees-bisi') advanced he was paid Rs 21 ('ikkis-ikkisi') rupees from the money received as neota. If the neota was not enough to clear the entire debt, the balance was converted into a regular loan and the prevailing rate of interest was charged on it.

IV
Agrarian Changes and Emerging Patterns of Informal Credit

The neota system declined during the late 1950s and early 1960s. This was a result of the broader process of agrarian transformation experienced during the post-independence period. Development of capitalist relations in agriculture weakened the sense of 'community' that the 'biradaris' had. Some got employment outside the village. Some others did not need neota any more to finance a wedding. After the green revolution, some of the smaller farmers too could save on their own and did not need to depend on neotas for a wedding. Alternative sources of finance also became available. Once a few members defaulted, the whole system crumbled.

Surprisingly, the neota system had weakened even among the landless labourers though most of them continued to depend on credit for financing weddings. When asked 'why did you not continue the system?' they often reported, 'it is very difficult to keep the system going. One cannot afford to waste a day's labour for attending a wedding in a far-off village just for the sake of neota.' Some reported that 'others did not bother to return the standing neota amount so why should we keep paying'. However, the neota was not completely out, though it had lost its significance. Bisi-ikkisi system declined along with the neota system and so did the sahi-sammi relations.

The rise of a 'landlord class' under the leadership of Chottu Ram of the Unionist Party in early 20th century and the passing of the Land Alienation Act of 1901 had started weakening the position of the banias in relation to the big landowners in the local society. However, in the absence of alternative sources of credit, the sahi-sammi system continued without much change for a while and most of the peasants continued to depend on the banias for all kinds of credit needs. A major blow to the system came with the initiation of developmental processes during the 1950s. The success of green revolution during the 1960s and a simultaneous development of marketing networks where the surplus yield could be sold at competitive prices, led to a near complete transformation of the closed system of 'credit-production-trade' network. The sahi-sammi system was almost completely out by the late 1960s or early 1970s.

Initially the bigger landowners and gradually all categories of farmers, started taking their surplus yield to the new marketing centres locally known as 'mandis'. The surplus yield was either sold to the traders or to the official agencies through the 'arhtias' (commission agents). The central government started fixing a minimum procurement price. The market could no more fluctuate much. If the traders did not buy, the official agencies bought at the minimum procurement price. This took care of any possibility of 'distress sales'. In order to consolidate their business, the arhtias started advancing money to the cultivators for financing the crop provided the farmer promised to sell his surplus yield through the creditor arhtia. Thus, the new marketing network also provided an altenative source of credit. Simultaneously the Primary Agriculture Credit Societies (PACSs) came up and started advancing credit at cheap interest rates.

Once the villagers went out of the village to sell their farm yield, they also started purchasing from the mandis some of the commodities that had so far been supplied by the banias. Gradually the dependence of the peasantry on the banias declined. The banias started losing their business and faced redundancy.

The introduction of adult franchise and democratic institutions led to changes in the power structure at the local and regional levels. This further marginalised banias in the village society. On the other hand, increase in the productivity of land strengthened the economic position, particularly, of the big and the very big landowners. The introduction of *Panchayati Raj* provided them with the required institutional power as well.

Not only were there alternative sources of credit available, some of them did not need credit any more. The big/very big farmers could advance money to the labourers from their own savings. One consequence of this was a near complete erosion of the authority that banias enjoyed over the peasants. Some

of the farmers even started challenging the banias. Incidence of the defaults of bania loans multiplied. The farmers would still buy things from the banias but would not give them the surplus farm yield and at times would not bother to even clear their accounts. In the emerging power structure, at the local and state level, dominated by the landowning castes, the banias could rarely expect the state agencies or police to help them if the cultivators defaulted.

The response of the banias was predictable. Over the years they had accumulated enough wealth to be able to shift to the emerging marketing centres, towns and cities. Some opened arhtia shops, some others started new businesses and still others took up government jobs. By the mid-1970s most of the bania families had migrated to urban centres. Those who did not migrate were the ones who were comparatively poor amongst them.

Out of some 20 bania families in the early 1950, only five were left in village-I. In village-II also, out of 22, only four bania families were left. One of them was a petty shopkeeper and the rest had their bread-winners employed as school teachers in schools around the village. In village-III, six out of 15 [illegible] still in the village. Three of them were petty shopkeepers and in the case of the other three, the earning members of the family commuted daily to the nearby town where they were employed. One of the bania petty shopkeepers in village-II reported, "it is becoming increasingly difficult to do business in the village. The villagers, particularly the landowning farmers, are bad customers. They purchase from us on credit but refuse to clear their accounts". His two sons were already settled in Delhi and he too was planning to join them soon.

Nature of Indebtedness

In the literature on agrarian indebtedness, an important distinction is made between the institutional and informal sources of credit. It is generally postulated that, with the process of development, institutional sources of credit tend to replace the informal sources. This change is supposed to indicate a substantive transformation in the agrarian structure. While indebtedness to institutional sources is viewed as an indicator of participation in the process of development, indebtedness to informal sources is seen to imply 'backwardness' and, if it is a dominant form of credit, such an economy is characterised as a pre-capitalist one where exploitation still takes place predominantly through usury [Bhaduri 1984; Prasad 1974].

Though 'informal credit' is not a homogeneous category and not all types of informal debt imply backwardness, this distinction can be a useful starting point for understanding the changing relations of credit and debt.

The literature on rural credit tends to suggest that the access to institutional credit in rural India is directly related to the landownership patterns. While the bigger landowners have, by and large, been able to monopolise the institutional sources, the smaller cultivators and landless labourers have continued to depend upon the informal sources of credit, indicating their non-participation in the process of development [Thorner 1964; Herring 1977; Frankel 1971]. While the data collected from the three study villages tends to support this thesis to an extent, the existing situation was far more complex than it would seem at first glance.

Out of the 185 respondents from different categories, there were 52 who had never borrowed from an institutional source and, among them, as many as 41 were either agricultural labourers or those farmers who owned less than five acres of land. Another 31 respondents from these categories had availed loans only under IRDP schemes. In contrast, out of 75 respondents who owned above five acres of land, as many as 64 (85.33 per cent) had been regularly borrowing from commercial banks or PACSs.

Table 1 provides information about the average indebtedness of the various categories of respondents to institutional and informal sources of credit in the three study villages. As far as indebtedness in absolute numbers is concerned, it was the big farmers (and not the very big farmers) who had maximum outstanding debt while the casual labourers were the least indebted category. But to take this fact at its face value would be extremely misleading. It is the source of credit, which also indicates the uses that the debt is put to, that is crucial. And here, it was the very big farmers who, on an average, managed to get maximum institutional credit. The attached labourers had the minimum standing debt to institutional sources. In contrast, the attached labourers, even in absolute numbers, had the maximum average informal debt while the very big farmers had the minimum.

Proportionately, the attached labourers (87.9 per cent) and marginal and small farmers (72.3 per cent) depended the most on informal sources of credit. Among casual labourers, this dependence was a little less (58.9 per cent). On the other hand, the very big farmers had borrowed only 11.9 per cent from informal sources. The other categories of farmers (middle and big) too had borrowed less than one-fourth of their credit requirements from informal sources.

The data pertaining to the number of respondents free from different types of debt also reveals, more or less, a similar pattern (Table 2). In general, the number of respondents had no informal debt (25.9 per cent). However, categorywise, out of a total of 30 attached labourers, 21 had no institutional debt while there was only one who was not indebted to an informal source. While among the big and very big farmers, only 17 out of 51 did not have a standing loan with an institutional source, the number of those in the category who had not borrowed from informal sources was also quite high (25 out of 51).

Though the data on the extent and nature of indebtedness to different sources could be a useful starting point, perhaps more important would be to understand the emerging patterns in the rural credit market and ask questions, such as, who borrows from whom?, for what kinds of needs? and, on what conditions? What is the nature of emerging relations in the credit market and how do these relations mediate or influence relations in the sphere of production, marketing and politics?

Needs for Credit

Though the source of credit does indicate the needs for which credit is required, the dependence on informal sources itself was of a different nature for different categories of resondents. As shown in Table 3, for the agricultural labourers, the most compelling reasons that made them borrow from informal sources were the weddings, followed by needs for house renovation/construction, daily consumption and illness in the family.

Table 4: Major Informal Sources of Credit Available to Various Categories of the Respondents

Category	Arhtias	Local Farmers	Petty Shop-keepers/ Local Money-lenders	Relatives/ Friends	Do not Need Informal Credit	Total
Attached labourers	0	29	0	1	0	30
Casual labourers	0	28	15	2	0	45
Small and marginal farmers	15	12	5	2	1	35
Middle farmers	19	1	0	1	3	24
Big farmers	25	0	0	0	4	29
Very big farmers	12	0	0	0	10	22
Total	71	70	20	6	18	185

Only three of them reported to have borrowed for some productive investment. In contrast, most of the cultivating farmers had borrowed for productive investments in land even when they borrowed from informal sources. While most of big/very big farmers rarely borrowed for any other needs, the small/marginal and middle farmers often needed to borrow for weddings, house construction and, at times, even for consumption.

Surprisingly, not many respondents needed to borrow for consumption requirements. Only some agricultural labourers and a few small/marginal farmers reported that they had to regularly borrow for the daily consumption needs. Two factors seem to be responsible for this. First, the success of the green revolution led to an increase in the income of different strata of the society and so most of them could take care of their consumption requirements.[3] Second, consumption goods were easily available from the local petty shopkeepers on a six-monthly credit basis for which no interest was charged. Therefore, it was rarely reported as a debt by the respondents.

One of the critical needs for which respondents, particularly the labourers and smaller farmers, had to depend upon informal sources was a wedding. Dowry and a social function being necessary parts of a wedding, it involved a considerable amount of expenditure. Though dowry was still not a very serious problem among most of the social groups in the study villages, it was considered essential.

The success of the green revolution has promoted a consumption culture at least amongst those who have the surplus. A growing tendency to give consumer goods as part of the dowry among the richer farmers could be easily observed. But its extent was still much lesser than amongst their urban counterparts. The total expenditure on a wedding varied between Rs 5-15,000 among labourers and marginal farmers. Among other categories it went up to 50,000 or at times even up to Rs 75,000.

While labourers and smaller farmers often borrowed for unproductive expenditure, the middle and bigger farmers generally borrowed for investments in land. Out of 77 farmers (including small/marginal farmers) who reported having borrowed regularly or occasionally from informal sources, in 45 cases, they had borrowed the maximum for investment in land or for purchasing some productive asset. In most of these cases, the amount was borrowed for short-term investments on crop.

Sources of Informal Credit

Broadly speaking, there were five categories of moneylenders in the informal credit market. They differed in terms of their social background, the kinds of loans they advanced and their clientage. These were, first, the petty moneylenders who were generally small and marginal farmers; second, the petty shopkeepers; third, the big/very big farmers; fourth, the arhtias and fifth, the relatives and friends (if they can be described as a category of moneylenders).

Table 4 shows the source of credit available most easily to the different categories of respondents. While for agricultural labourers the main source available was the local big/very big farmers, for the farmers, in general, and for the middle to very big farmers in particular, it was the arhtias in the mandis. Out of the 92 respondent farmers who occasionally or regularly borrowed from infomral sources, for 71 (77.2 per cent), arhtias were the main source. However, a majority of the small and marginal farmers depended upon the local informal sources because arhtias did not advance them enough to meet their credit requirements.

A detailed discussion of the different categories of informal credit, their clients, nature of their credit and the kind of obligations it involved may help in developing a clearer understanding of the structure of the informal credit market.

Petty Moneylenders

Though not of much significance, the petty moneylenders existed as a qualitatively distinct category of moneylenders. Most of them were small or marginal landowners who could be self-cultivating or leasing out their lands to other farmers. Some of them were aged persons with a small or no family. One of them was also a widow. They usually lent small amounts — ranging between Rs 100-150 and the total capital they operated with was not much either. It varied between Rs 5,000-Rs 30,000 or in some cases a little more.

Their clients were understandably from the lower strata of the village and most of them were personally known to the moneylenders. If the current was new or the moneylender did not trust him, he was rarely advanced a loan without a collateral security. The collateral security was usually ornaments. There was also a case where a moneylender had advanced Rs 10,000 to a marginal farmer against mortgage of an acre of land.

Unless against a collateral security, petty moneylenders advanced loans for short periods only — ranging between two months to six months. Generally, the amount was returned after the harvest and in case the borrower was unable to pay the entire sum, he paid the interest while the principal amount kept standing till the next harvest.

Petty moneylenders' loans were generally costlier than other sources. The minimum interest they charged was 2 per cent monthly though very often up to 3 or even 5 per cent monthly rate was charged. They rarely lent without taking signatures or thumb impressions of the borrowers in their account books. In some cases they also sought a witness. Though it did not have any legal value, it helped the moneylenders in realising the amount. In case of default, the 'agreement' could be used to put social pressure on the borrower including through the panchayat. Making a case of default harmed the status of the borrower and he lost his creditworthiness in the local market.

Petty Shopkeepers

The decline of the sahi-sammi system on the one hand, and growing purchasing power in the rural society on the other, gave rise to a new economic activity, i e, petty shopkeeping. Though some of the farmers bought consumption goods from the mandi or the nearby town, there were many who did not have enough surplus for buying everything from the urban market. The petty shopkeepers fulfilled this gap. Their shops were like mini departmental stores where items ranging from green vegetables to sugar and shoes and, in some cases, even clothes were available.

Though, like the traditional shahukars, they also sold on credit, their primary interest was in the profit from sales and not in securing control over the farm yield of the borrower.[4] Thus they were very different from the traditional shahukars. Village-I had 25 such shops while village-II and III had 15 and 10 respectively. Petty shopkeepers came broadly from three different social categories. First were the banias, some of whom were themselves shahukars earlier. Second were the Punjabi aroras, who came from western Punjab at the time of the

Table 5: Monthly Interest Rates Usually Paid on Informal Debt by Different Categories of Respondents

Total	1	115	19	2	30	18	185

partition and settled in the region and third, a relatively new category, was that of the marginalised landowners who found their holdings unviable and opened such shops for additional income.

Petty shopkeepers were quite an important category in the local credit market. They advanced two types of credit. One, in-kind credit, i e, the consumer goods sold on credit; and two, cash credit. Most of the households had their account with at least one of the petty shopkeepers in the village and bought goods of daily consumption on credit. Depending upon the past experience and economic status, a petty shopkeeper advanced between Rs 100-Rs 2,000 worth of goods to a single family The accounts were generally cleared at the time of harvesting and only in a few cases did it go beyond a six-month period.

Most of the customers cleared their debts with cash payments from the money received after selling their surplus yield in the mandis. A few small/marginal farmers and labourers also paid them partly 'in-kind'. They gave them paddy or wheat (farm surplus/in-kind wages) to clear their standing debts. However, this was very different from the traditional sahi-sammi system. The shopkeepers was paid in-kind because it was convenient. The prices for farm products that the shopkeeper paid was at par with the prices in mandis and it saved the farmer the trouble of taking the yield to a mandi. Being marginal in the local power structure, these shopkeepers could rarely, if ever influence the prices.

For the petty shopkeeper, more important was the fact that his account was cleared. He did not mind payment in kind. Some of them even had the economic position to be able to store wheat or paddy and sell it when the prices went up.

The second category of their credit, i e, cash loans, were not very different from the loans of 'petty moneylenders'. They too lent small amounts of cash, generally to agricultural labourers and small/marginal farmers. The range and conditions of their cash loans were quite similar to those of the petty shopkeepers. However, they also advanced, what can be described as 'arranged credit', or what Bhalla calls 'managed borrowing' [Bhalla 1976]. This is an arrangement between three parties — the borrower who is generally an agricultural labourer, the lender, i e, the shopkeeper and a third party guarantor who is generally a big landowner who does not want to lend to a labourer because he himself is not sure of being able to recover the debt and yet would like to oblige the labourer

Moneylending by Big Farmers

Crediting by big/very big farmers was more than just another form of moneylending. In most cases, they did not lend merely for earning interests. Their loans carried other obligations that influenced the social relations of production and the village politics. These loans played important mediating role in reproducing relations of dependency between landowning farmers and the labourers [Breman 1974; Brass 1990; Jodhka 1994].

The prosperity ushered in by the green revolution was not equally shared by every one. On the contrary, capitalist development in agriculture widened the gaps, particularly between the landless labourers and the substantial landowners. Though demand for labour went up, labourers still had only subsistence level of income. So, whenever, there was an additional expenditure, such as on a wedding or renovation of a house, or in case of a serious illness in the family, this category of villagers often had to borrow. Since employment in agriculture was not available throughout the year, agricultural labourers often had to borrow for meeting consumption requirements itself.

As mentioned above, in most cases the only source available to the labourers were the big/very big farmers. As shown in Table 4, for 50 out of 75 labourers interviewed, they were the main source of credit. Even for the small/marginal farmers, they were an important source of credit

Development of agriculture has, on the one hand, helped the bigger farmers generate enough surplus to be able to lend but, on the other hand, the practice of sowing multiple crops and high yielding varieties has also made them look for assured and timely labour supply. Crediting helped them tie labour. It also helped them in the village politics. Out of the 58 farmers who regularly lent money, as many as 41 reported that the primary reason for lending was either exclusively to tie the labourers (23) or with a dual interest of earning interest and tying labour (18). Only eight of them reported that they lent just for earning money.

There were broadly two types of labour-tying-credit advanced by the farmers. First, for peak season labour-tying to the casual labourers and second, to the attached or permanent labourers to keep them committed to the farmer for the whole year or, at times, even longer. While attached labourers 'mortgaged out' their labour power for a whole year against an interest free credit in the form of advance wages [Jodhka 1994], the casual labourers promised to work, generally with their families, for the crediting farmer during the peak seasons such as during harvesting or paddy transplantation.

The amount lent for the peak season labour tying depended upon the labour requirements of a farmer and family size of the labourer. If the labourer had a large family to work in the fields, he could get more loans. Similarly, a smaller farmer lent lesser amount because their need for labour was limited. They lent between Rs 50 to Rs 200 whereas the bigger farmers lent up to Rs 500 to a single family and in total up to Rs 2,000 for this purpose. This credit was generally advanced two weeks to three months before the peak season. However, if the amount was more than Rs 50 interest was usually charged at the rate of 2 per cent monthly. A farmer in such cases lent up to a maximum of Rs 10,000.

Though some of the small/marginal farmers also lent money for tying labour, most of them could not do so very effectively. A majority of the big farmers lent to tie labour. This resulted in selective employment preferences by labourers. Many small farmers reported that they had to wait to get labour during the peak seasons because the labourers first worked with the big farmers.

However, loaning rarely influenced wages. Only two farmers reported that loaning helped them in getting labour at cheaper rates. And none of the labourers repored to have worked at wages lower than the prevailing wage rates in the village when they borrowed in advance from the farmers. Neither did any of the labourers report to have worked with any specific farmer for the reason of being afraid of physical coercion. When a labourer preferred working with a particular farmer, it was usually out of 'mutual favour' or 'lihaz' rather than 'physical coercion' or 'dabav', going by what was reported by some of the labourers as well as the farmers. It may be important to mention here that these relations did not fit into the category of what Thorner had called the 'beck and call' system. Unlike the 'naukar' or 'sajhi' system, it did not have a local name and it did not function as a system or produce serious dependencies of the labourers over the moneylending farmers.

The permanent or attached labourers were a perpetually indebted category. As I have discussed elsewhere, the reason why workers chose attached labour was almost always a need for credit and, in the absence of an alternative source, they had to 'mortgage-out' their labour power to secure interest-free loans in the form of advance payment of the annual wage [Jodhka 1994]. Big farmers not only paid them the wages in advance, they also did not mind lending more than the annual wage. Though they often charged an interest of 2 per cent monthly on these loans, the main interest of the farmer was generally in making sure that the labourer continued working with him for the next year.

However debt could not always discipline the labourers. These relations were marked by tensions and conflicts. There were cases where a labourer refused to pay back the outstanding debts and also refused to work with the farmer. One of the consequences of the growing tensions was a trend towards a decline in the system of attached labour.

Just as the middle/big farmers were the main source of credit for agricultural labourers, the arhtias were the principal sources of informal credit for the farmers. Out of the 92 respondent farmers who reported to have been borrowing from informal sources, arhtias were the main source for 71 (77.2 per cent).

The green revolution not only increased productivity, it also multiplied expenses on land. HYV seeds, fertilisers and pesticides were all to be bought from the market. With banias no more left in the village, farmers needed alternative sources of credit. Institutional credit remained limited to some specific categories of cultivators only and did not fulfil all kinds of needs.The arhtias provided a viable alternative.

Development of marketing networks was one of the components of the developmental efforts. The mandis were opened to provide an alternative to the traditional system of commerce such as the sahi-sammi system. The first mandi in the region came up in 1945 but it was only during 1950s and early 1960s that the mandis became popular with the farmers. Arhtias were the middlemen through whom the farmers sold their yield to the private traders or to the state agencies. The arhtias received a fixed amount of commission on sales of farm yields. Their business was dependent upon the amount of farm surplus that farmers brought to them. So, in order to assure their business, they started advancing to the client farmers. The form and contents of their loans was something in between institutional loans and the local informal credit.

Arhtias had a fairly good assessment of how much wheat or paddy a particular farmer was likely to bring to them. They generally advanced up to 50 to 60 per cent of the value of the expected yield. The amount was usually advanced by taking signatures or thumb impressions of the borrower farmer in an informal account book. Arhtias rarely asked for security. When a farmer approached an arhtia for the first time, he was asked to bring an 'introducer' from his village who already had business with the arhtia. The arhtia would cross-check about the 'character' of the new client, his land and standing crop, etc, from a few other farmers from the same village and, if he was satisfied, he would advance money to the new client. Even in the case of his regular clients, the arhtias kept information about the standing crops in their fields on the basis of which they assessed how much they could safely advance to a particular farmer. Their sources of information were the farmers themselves from whom they kept inquiring about one another's standing crops and expected yields.

Arhtia's credit was much more flexible than the institution loans. Though most of the times farmers borrowed for their short-term investments in land, they could also get money for a wedding in the family, consumption requirements or even for purchasing land and farm machinery. Arhtias rarely bothered about the uses their loans were put to as long as they were sure that the farmer would be able to clear off the debt. Though in most cases arhtias charged interest at the rate of 2 per cent monthly, the prime motive of their lending was commercial. They were interested in the farm yield. By advancing money, they assured their business. And unless the money was advanced, they could not expect much business. On the other hand, an indebted farmer not only sold his yield though the arhtia from whom he borrowed, crediting also made it sure that the farmer took his farm yield to the mandi even if he had no 'surplus'.

This compulsion was obviously felt mainly by the smaller farmers. The bigger farmer felt no such compulsions. They often had more than one arhtia and sold their yield in more than one mandi. One of the big farmers reported that during the previous year he had taken his superior quality (basmati) paddy to a mandi located around 40 km away from his village because the prices were higher there (the nearest mandi was just four km away).

Arhtias were fairly united in relation to the farmers. They did not encourage the farmers to shift from one arhtia to another within a mandi. Perceptions of farmers about their relationship

with arhtias were largely positive. It was only the marginal and small farmers, who also depended more on their loans, who had complaints against arhtias. They felt that arhtias cheated by manipulating the scaling of their yield and charged higher prices for fertiliser bags, pesticides or seeds bought from or through the arhtias. However, arhtias were not powerful enough to dictate terms to the farmers or fluctuate prices.

The main attraction of their credit was their easy availability. Farmers generally had very informal relations with their arhtias. Whenever they needed credit, they had to just sign on the account book and they got the money. At times a farmer could get the money by simply sending a note through another person. In contrast, most farmers found institutional credit quite cumbersome. Also, many small farmers had to borrow from arhtias even if they had 'crop loan' accounts with banks because their needs exceeded the maximum amount they were allowed to borrow for the crop. Some expressed apprehensions because of the prevailing corruption in the local PACS or they were afraid of the institutional credit as such [for details see, Jodhka 1995a].

Credit Relations Among Relatives and Friends

In 'traditional' societies, a part of the credit needs are met by what Weber describes as 'neighbouring help' [Weber 1978: 361]. Many anthropological studies have reported the existence of such relations among neighbourhood groups where people depend on each other for help both in daily life and in times of crisis. This 'subsistence credit' is generally interest free [Dewey 1964; Abraham 1985].

Though social relations had changed considerably, and in most cases even the informal credit relations seemed to be operating within the logic of a capitalist market, there still existed some kind of 'neighbourhood credit relations' in the study villages. These relations were generally among relatives. However, in the total credit transactions, it was at best a marginal phenomenon. If the amount borrowed was up to about one thousand rupees and it was not borrowed for more than a month or so, generally no interest was charged. In other cases, with the exception of some relations, a monthly interest of 2 per cent was charged. In case of a 'delicate' relationship, such as with a son-in-law, it was unlikely that interest would be charged at all.

Some respondents from the lower castes/ agricultural labourers reported that if they approached their relatives for credit, it harmed their 'prestige'. The relative might think that "we had so bad an image in the village that we could not avail credit on our own from the village". These loans obviously carried social obligations. However, these are of little significance as far as the overall logic of agrarian relations in the present day Haryana agriculture is concerned.

VII
Interests and Securities in Informal Debts

The demand and supply principles of textbook economics seemed to have only limited relevance in the determination of interest rates in the informal credit market. Apart from economic variables, it depended on various sociological factors such as the status of an individual in the village, his class and caste background, etc. The logic of production relations and factional politics also played a significant role in the determination of interest rates. The source of credit available to a specific borrower was important too.

As given in Table 5, out of 185 as many as 115 respondents usually paid 2 per cent monthly interest rate. Another 19 paid back at the rate of 3 per cent. There were 30 respondents who could generally get credit without paying any interest. Two respondents reported that it was very difficult for them

to get credit from informal sources and they had to usually pay up to 5 per cent monthly interest rate if they needed to borrow some money from an informal source.

The petty moneylenders usually lent at 3 per cent monthly interest rate though at times charged up to 5 per cent monthly. Only in those cases where a collateral security was offered, or where the amount was lent to a 'trusted' person, they would charge 2 per cent monthly. Petty shopkeepers charged in a similar fashion. The arhtias generally charged 2 per cent monthly. In some cases, they did not charge any interest if the farmer borrowed occasionlly and the amount borrowed was small. In some other cases an arhtia neither charged any interest from a farmer, nor did he pay him any if farmer's money was withheld for more than a month. In a few cases, they also charged up to 3 per cent from smaller farmers, if the amount lent exceeded the expected yield of the farmer.

The credit of the big/very big farmers was the most complex. In most of the cases, they charged 2 per cent interest but it depended on the relationship of the borrower the farmer. For example, the money lent for labour tying was generally interest free. Similarly, a farmer would lend to a small farmer or an agricultural labourer with the intention of patronising and winning him over to his side in village politics. Yet in some cases, they were also known to charge up to three per cent monthly interest rates.

At times, apart from interest, collateral security was also required for availing credit. However, a substantial part of informal crediting operated without any securities. Only in some cases did the creditor demand security. These were generally the cases where the borrower was not trusted by the lender and the amount needed was more than a few hundred rupees. These borrowers were almost always landless or small and marginal farmers.

Mainly two types of securities were given – ornaments and land. When land was mortgaged against a specific amount of credit, no interest rate was paid to the lender. The lender cultivated the land or shared it out either to the borrower or to some other farmer. In most of the cases, land was mortgaged in by landowning self-cultivating moneylenders. One petty shopkeeper in village-I had also mortgaged in one acre of land against a debt of Rs 10,000. The land remained with him for three years. Ornaments were preferred most by the petty moneylenders/petty shopkeepers. It was generally the landless labourers who gave ornaments as security. When a collateral security of ornaments was given, the interest rate was moderate, usually 2 per cent monthly.

Perhaps more important than the collateral security were the other social obligations that the informal credit carried. As mentioned above, an agricultural labourer had to 'mortgage' his labour power (labour tying) for availing credit. Small and marginal farmers and agricultural labourers had to reciprocate in social and political life, particularly when credit was taken from the local big and very big farmers or from relatives.

Informal Credit and Rural Power Structure

The issue of relationship between credit and the structures of power and domination in village society is rather complex. It was not possible to collect any quantifiable information on the subject. Yet there existed a clearly identifiable connection between the two, though not in all types of informal credit relations. For example, there existed no relation, whatsoever, between the petty shopkeepers' credit or petty moneylenders' credit and the local politics. Those who lent exclusively for earning interest, as was the case with these two categories, made it a point not to demand anything other than the interest from their clients. Similarly arhtia who was the most important informal source of credit for farmers had nothing to do with the village politics.

It was mainly the big and very big farmers who had stakes in local politics. They were most interested in capturing the local institutions of power. Factions in the village were led by them. The village sarpanch usually came from this category. Numerically constituting the largest group, they qualify to be treated as the 'dominant caste'. As discussed above, in the local credit market, they were one of the main sources of credit particularly for the marginalised sections, such as the lower castes who also worked in their farms as casual or attached labourers. Being the poorest among the poor, they almost regularly needed credit. Some of the marginal farmers also depended on the big/very big farmers for their credit needs.

There was sufficient evidence to suggest that the bigger farmers were able to exert influence particularly on the labourers because of the credit dependence of the latter on the former. They used this influence for consolidating their factions in the village politics. Most of the attached labourers and formerly attached labourers reported that as an attached labourer, one could not afford to offend one's farmer, particularly because of the credit dependence. During panchayat elections, the big/very big farmers tried to mobilise their attached and casual labourers in favour of their factions. There were some cases where, the farmer himself being a candidate for the post of sarpanch or panch, his attached labourers actively campaigned for him. Credit was more easily available from a political aspirant or a leader of a faction. Those who needed credit often, tried to keep their lenders happy by voting in their favour. For example, a casual labourer from village-II made a subtle comment on the relationship of credit and village politics. To quote him:

> A labourer has to keep the 'zamindars' happy. We often need credit from them. They give us employment too. During the last panchayat elections, there were two candidates from the two main factions. Both were big farmers. I did not want to antagonise any one of them. I have two votes – mine and my wife's. So, we casted one each to both the candidates.

(An important fact to be noted here is that apart from the two big farmer candidates, there was also a lower caste candidate belonging to the caste of the respondent. But the respondent did not even consider him for his vote.)

However, credit or indebtedness could not always influence local politics as per the wishes of the big farmers. Increasing formalisation of relations in the village society and growing tensions and conflicts, particularly between labourers and big farmers, are significant in this context. In many cases, the labourers did assert. For example, during a group interview one labourer, chamar (SC) by caste, reported:

> During last assembly elections, a jat farmer wanted us to vote for the party of his choice. We decided not to oblige him and voted for the candidate of our choice. This offended the farmer. He immediately asked me to return the three thousand rupees which I had borrowed from him. I arranged the money within a week from a bania and paid back the amount though I had to pay a little higher interest rate.

The caste biradaris were also important in local politics. Biradaris generally acted collectively during the local elections and at the time of assembly elections. Even if a member of a caste was an attached labourer or otherwise indebeted to a farmer, he had to give considerations to the wishes of his caste biradari as well. If the farmer was able to influence him to vote in his favour, the biradari in such cases did not allow the individual labourer to campaign for the candidate of his farmer's choice.

Apart from the changes in the relations between farmers and labourers that accompanied agrarian change, programmes like IRDP were also being used as alternative sources of credit by its beneficiary labourers [Jodhka 1995b]. There was a process of weakening of the authority of creditor farmers over the borrower labourers and marginal farmers. This had also led to a squeezing of the informal credit market. Some labourers, particularly from village-I and II, reported that it was becoming increasingly difficult for them to get credit. The moneylenders too felt hesitant to lend in the local market. Ram Chand, a big farmer (14 acres), had been a regular moneylender. He generally lent to small/marginal farmers and agricultural labourers. He charged an interest rate of 3

per cent monthly. Presently, he had Rs 20,000 advanced to different persons. Apart from this he also had one acre of land mortgaged in from a marginal farmer for Rs 9,000. During the last five or six years he had intentionally contracted his business. As he put it:

> Till a few years back, we used to lend more than what we do now. The environment ('mahol') in the village is changing and lending has become more risky. The demand has not decreased but we hesitate to lend, particularly, to labourers. Earlier they themselve paid back in time We used to lend to a single person up to Rs 10,000 Now things are different. They borrow but do not care to return in time. So now we do not lend them more than Rs 2,000 Usually, we try to get a collateral security.

Another big farmer whose family had been in the business of moneylending for the three generations elaborated more on this process:

> The situation has changed particularly during the last four or five years. This change has come about with the increasing popularity of the subsidised bank loans (IRDP) given to the labourers Earlier, the labourers were exclusively dependent on us for credit. We could trust them. We lent them up to Rs 10,000 and at times even more

An additional factor responsible for this change was the weakening of authority of the village panchayat. Initially, a few big/ very big farmers violated the panchayat decisions. This led to an overall erosion of the authority of the institution Then, even the lower castes did not bother much about the village panchayat. So, if a moneylender took a case of default to the panchayat it did not necessarily have the desired impact.

A related tendency was the growing incidence of 'arranged credit'. The big farmers, instead of lending to the labourers themselves, preferred to become guarantors In these cases, the amount was generally advanced by the petty shopkeepers and a big or very big farmer had to provide surety. In this way, he was able to oblige the labourer and at the same time he did not have to bother about getting the money back. It was easier to get the money back for the petty shopkeeper or a professional moneylender than it was for the farmer. These changes had led to a change in the equation between power and credit. Though credit relations had not become completely formalised, the relationship of credit with power was more complex and less decisive than it was a few decades back.

VIII
Conclusions

Being exploratory in nature, the primary question for the study was to identify emerging patterns of relations in the informal credit market. The context of such a study is provided by the agrarian transformation experienced during the post-independence period and the increasing popularity of institutional sources of credit. Though it may not be very difficult to identify elements of continuity, the changes experienced during the last four or five decades are also very significant. The bania-centred traditional credit market, i e, the sahi-sammi type of relations had been completely transformed. It is difficult to identify just a single dominant factor that has brought about this change. One has to look at the way various factors come together and produce such a change from a historical perspective.

The liquidation of traditional bania moneylenders does not merely mean a change in the source of credit available to the cultivators. It has also meant a significant change in the rural power structure. Coupled with other factors, it has paved the way towards a growing domination of the rich landowners from the middle level agricultural caste groups. This section was already an important component of the rural society and the withdrawal of banias led to a near complete monopoly of this category in the local power structure. To some extent this change is also reflected at the state level politics.

The arhtia-farmer credit relations may appear to be very similar to the traditional sahi-sammi kind of system, but the two are very different substantially. Despite the fact that the arhtias did lend primarily for commercial reasons, i e, to make sure that the farmers brought their surplus yield to the market, this operated within the broader logic of a market economy and is closer to what Harriss described as 'compulsive market participation' [Harriss 1987] rather than the 'forced commercialisation' of semi-feudal nature

Notes

[I am grateful to D N Dhanagare, P N Pimpley and Tom Brass for their comments on an earlier draft of this paper. K Sneha Sudha helped with revisions Needless to say, errors and omissions are mine.]

1 A large volume of historical literature is available on various dimensions of the agararian changes and peasant indebtedness during the colonial period. [See, for example, Raj et al (eds) 1985; Darling 1947; Moore 1966, Desai 1979, Dhanagare 1983; Hardiman 1987.]

2 This paper is a part of a broader study of agrarian change and debt dependencies in Haryana agriculture. Field work for the study was carried out during 1988-89 over a period of six months. Apart from observations and interviews with various categories of people, 185 case studies of farmers and labourers were conducted.

3 The recent study by Shergill and Singh of poverty in the post-green revolution Punjab tends to confirm this [Shergil and Singh 1995].

4 All the respondent shopkeepers reported that it was impossible for them to do business in the village unless they sold on credit. Nearly 60 to 70 per cent of their total business was on credit.

SOUTH ASIAN SURVEY

Editor-in-Chief: **Eric Gonsalves**
Editor: **Nancy Jetly**

The journal aims at enhancing the understanding of South Asia among the countries of the region and beyond. In this context, the journal serves as a forum to share fresh thinking and to debate matters of national and regional concern to the countries of South Asia from their perspectives. It carries contributions from scholars, policymakers, civil servants and journalists providing in-depth analysis with a multi-dimensional approach.

Call for Adjustments in Structural Adjustment

M H Suryanarayana

Structural Adjustment and Agriculture: Theory and Practice in Africa and Latin America edited by Simon Commander; James Currey Publishers, London; pp 250, paperback £ 11.95, hardback £ 30.

SINCE the 1980s, there have been considerable programme lending by the Bretton Woods twins particularly to the sub-Saharan African and Latin American countries to overcome problems caused by low economic growth, persistent balance-of-payments disequilibria and high levels of domestic imbalances. Given the growing indebtedness among developing countries, declining terms of trade and the presence of high interest rates, such adjustment lending is likely to increase. For countries of sub-Saharan Africa and Latin America, where stabilisation and adjustment programmes were constrained by institutional and market rigidities as well as high external debt and domestic inflation, the costs of the programmes turned out to be very high depending upon the scale and rate of supply response, and demand reducing effects of expenditure reducing process. In this context, the book under review examines the suitability of classic stabilisation programmes and the appropriate ways of attaining structural adjustment through supply-side responses. This is because the core of conventional adjustment programme consists of expenditure reduction and expenditure switching processes wherein the latter involves shifts in relative output prices in favour of tradables and hence largely agriculture which is the principal source of tradables output in these countries. This naturally raises questions about the instruments used for expenditure-switching, how the country goes about undoing the discrimination against agriculture through pricing, marketing and taxation and how far such reform measures can be made more effective through public investment and sector-specific interventions.

The volume under review attempts to address such issues with special reference to agriculture. It is a collection of essays classified into four parts: the essays in the first part deal with the framework of adjustment by incorporating the agricultural sector; the second part consists of multi-country studies that examine the consequences of the programme in terms of rural poverty alleviation, food security and nutrition; part three consists of country case studies of the adjustment programme which bring out the weaknesses in terms of reduced effectiveness of price reforms due to infrastructural constraints and market rigidities, weak supply responses and inadequacy of prior policies and hence emphasise the need for complementary policies such as public investment and sector specific interventions; and the fourth part contains an overview of the adjustment experience and indicates some options to deal effectively with the inefficiencies in the adjustment mechanisms.

Part one begins with a survey of issues and option in the design of structural adjustment for open economies by Streeten. Generally adjustment programmes are carried out to reduce or eliminate balance-of-payments deficit, achieve higher rates of growth and secure structural changes so as to insulate the economy against future shocks. An appropriate strategy depends upon the nature of shocks necessitating such adjustments, types of adjustment mechanisms resorted to, their social costs and the form and degree of government intervention. But quite often the Fund-supported programmes are criticised for being excessively preoccupied with short-run to medium-run stabilisation and external adjustment, neglecting long-run development issues, treating welfare related issues as secondary goals and being oriented towards domestic price, domestic credit and exchange rate measures. The bases for such criticisms are examined by Johnson. He outlines the analytical framework used to consider the role of agriculture in the adjustment programmes, the emphasis on terms of trade of agriculture and its aggregate supply response, and how the different parameters and pricing strategies emphasised in the programmes influence aggregate marketed output. The criticisms against standard IMF programmes *vis-a-vis* structural adjustment and the limits on the effectiveness of different IMF programme instruments are examined in the concrete sub-Saharan African context in detail by Green. In the light of the findings, Green sketches out a programme, parallel to the IMF programmes, which will be more viable. Given the critical importance of agricultural aggregate supply response to changes in the internal terms of trade in adjustment programmes, Chibber's careful review of empirical estimates of supply responses and choice of variables therein highlights the importance of non-price factors like provision of public goods and services in a balanced policy package to raise agricultural productivity. Agricultural productivity cannot be raised only by changing the incentive structure faced by farmers since supply response is also conditioned by available irrigation, research and extension services, power and other infrastructure. If so, adjustment programmes involving indiscriminate and across-the-board reductions in public expenditure programmes could even negate the expected supply responses from improved price incentives.

In much of the literature on implications of adjustment programmes for the poor, the focus has been on ex-post analysis of causative factors, identification of the affected poorer groups, and possible government transfers to mitigate the social costs. But the study by Addison and Demery is a refreshing outlier. They point out that the trade-off between poverty alleviation and the objectives of structural adjustment are complex. For instance, in countries with substantial rural landless poor depending on the market for foodgrain requirements, any increase in foodgrain prices to encourage production will have adverse effects on these poor. One strategic option in such cases would be measures to enhance access of the poor to productive assets so as to enable them to share the income gains from producer price increases and reduce the adverse effects on consumption. They emphasise assisting the poor through the processes that generate their primary incomes coupled with targeted allocation of scarce public resources on the most needy families. Pinstrup-Anderson, in this context, shows that Sri Lanka, Mexico, Brazil and other Latin American countries reviewed in the study experienced a decline in real wages along with an increase in food prices. These factors, combined with increased unemployment and reduced access to government services and transfers, led to a deterioration in the nutritional status particularly of the poor as shown by quantitative evidence. The study synthesises the current state of knowledge and factual information on short-term effects of adjustment policies on food security and nutritional status of the poor, its implications for structural adjustment policy design and action programmes for improving food security and nutrition of the poor.

Among the country studies in part three, Commander, Howell and Seini examine the impact of the IMF-World Bank interventions and the Economic Recovery Programme

pursued in Ghana since 1983 on the agricultural sector, illustrate the micro level impact of changes in producer and input pricing policy with a survey data of a core cocoa region, review the role of public sector agencies with respect to agriculture and the options available for further improvement including the feasibility of transfer to the private sector. Given the theoretical framework of the adjustment programme elucidated in part one and also given the emphasis on domestic policy inadequacies as being the causes for the economic downturn of last two decades, what strikes one most about the Ghana programme is its reliance on a limited range of policy instruments, particularly exchange rate and domestic relative prices with the primary focus on reviving the cocoa sub-sector. That increasing the relative prices of cocoa *vis-a-vis* foodgrains which, in addition to its adverse distributional implications, is likely to result in foodgrain shortfalls in a decade shows the limited time perspective and limited focus on human dimension of the adjustment programme. Even the short run costs of the adjustment programmes in terms of declining per capita incomes for urban inhabitants and non-cocoa farmers, rising unemployment compounded by substantial lay-offs in the public sector and reduced budgetary allocations for health and education have been heavy. The evidences from the survey do not lend any support to the pre-conceived notions of the Bretton Woods twins that public provision of services to farmers is highly inefficient. Inadequate infrastructure has been a major bane which hindered exports and marketable surplus; budget restructuring under the reform programme only perpetuated the situation.

The study on the Zambian reform programme by Kydd brings out the importance of the synergy between macro- and sectoral-level reforms. Inappropriate sequencing of reforms and the inadequate emphasis on agricultural reforms turned out to be an internal constraint on the adjustment programme. This coupled with the lack of institutional and political perspectives in adjustment strategy formulation seriously hampered the implementation of the reform programme. The social cost of the adjustment programme could have been reduced by raising efficiency of the food system. The study by Commander, Ndoye and Ouedrago for Senegal demonstrates the limitations of the IMF criteria in evaluating adjustment programmes and providing directions for development strategies. The programme, though radical, appears successful in terms of reduction in current account deficit and public expenditure. But the reduction in public expenditure has been across-the-board and arbitrary. Weak revenue performance due to deflationary economic policies necessitated increased recourse to external borrowing. The reduction in current debt servicing is due to substantial rescheduling and not due to any improvement in the tradables sector and overall economic growth. The emphasis on reduced budgetary transfers to the agricultural sector has been at the cost of a long-term strategy for the latter.

Most of the solutions formulated for promoting efficiency – efficiency of parastatals and of general resource use – in terms of reduced state interventions are based on unsustainable assumptions. The incentives provided by increases in producer prices of foodgrains have to be evaluated at a discount given their adverse welfare implications since the self-sufficiency of the average farm household is only about 65 per cent and the supply responses are low because of physical constraints. More than resource use efficiency, what is at stake are productivity-raising measures. Conventional trade theory is of limited use since Senegal does not have comparative advantage for any of the major agricultural crops. All these constraints call for public interventions as an integral part of a long-term strategy for undoing the suboptimal agricultural technologies and investments.

Morocco sought to go about the agricultural structural adjustment programme by restructuring public expenditures and investments towards quick maturing and high return investments, altering prices and incentives framework in favour of economically sound alternatives in agriculture, strengthen and rationalise the public sector role in providing agricultural support services and appropriate agricultural policies (Seddon). Actual implementation of the adjustment programme, however, has essentially been the result of a series of negotiated compromises between the Bretton Woods twins, concerned with financial and economic performance, and the Moroccan government, guided more by social and political implications of economic policy based on an understanding of institutional realities. The Moroccan government, for instance, has been cautious in eliminating consumer subsidies given the high degree of differentiation among the rural and agricultural population with a significant section being market dependents for foodgrain purchases even though the World Bank believed in major cuts in consumer subsidies.

The Columbian experience, on the other hand, illustrates a relative success story and shows how agricultural performance can be improved by appropriately linking sectoral policies like price support, credit subsidy and investments with macro measures involving exchange-rate management, import controls and fiscal policies (Thomas). At the same time, the study also brings out the limits to agricultural price support and protection measures and the importance of such non-price incentives as investments in infrastructure, research and extension and marketing. The Brazilian experience also suggests how appropriate government interventions can minimise the adverse implications of the adjustment measures for the agricultural sector (Castro de Rezende). Some of the measures to promote exports and sugarcane production, restrictive fiscal and monetary policies, particularly the reform of the rural credit system could have had detrimental consequences for agriculture. However, apart from favourable climatic conditions, government support measures like minimum price support policy and interventions in marketing played an important role in stimulating food crop production. As regards rural credit policy reforms, government decision not to curtail short-term production credit until 1983 led to agriculture's recovery from 1980. Thus, Brazil, by following measures to consolidate production of goods for domestic consumption as against export crops – a strategy running counter to the structural adjustment programme – largely because of the balance-of-payments constraint ensured domestic availability of food and hence reduced social costs.

The fourth part begins with supposedly a sceptical appraisal of structural adjustment by Bates. The policy inadequacies of the earlier systems have rendered them unsustainable; the current reform programmes only seek to revive the old order. The paper dwells at length on the various factors accounting for financial risks for private investors and political risks for decision-makers. As regards food security, the need for assurances against food shortages in the form of World Food Programme or international food bank is emphasised. Finally, the book ends with an evaluation by Commander of the degree of success of the stabilisation and structural adjustment programmes in raising economic performance in sub-Saharan Africa. The limited improvements in these economies are largely due to the shortcomings of the policy frameworks proposed by the twins of Bretton Woods. The adjustment programmes with their emphasis on price based policies, given the institutional rigidities and limitations, have their own problems of design with respect to the objectives for technical change and growth in agriculture and distributional goals. In sum, what emerges from the set of papers presented in this edited volume is the lack of even a facade of 'human face' in adjustment policy design and prescription by the Bretton Woods twins for the sub-Saharan countries. The studies, in general, are informative but some are only seemingly analytical and are haphazard in their orientation and structure and hence make painful reading.

Man Behind the Mission

Parshotam Mehra

Younghusband: The Last Great Imperial Adventurer by Patrick French; Harper Collins, London, 1994; pp xxii + 440, £ 20.

A RARE and in some respects even unique blend of an explorer, a geographer, writer, diehard imperialist, philosopher and mystic, Francis ('Frank') Younghusband, occupied insofar as British India was concerned, the centre stage in the last two decades of the 19th and the opening decade of the present century. In the 1880-90s, as a formidable explorer and mountaineer: across Manchuria and then the Gobi. And down the Mustagh. And later as the Raj's troubleshooter in Hunza, Sinkiang and the Pamirs. In 1903-04, he was to lead an obstensibly peaceful mission across the Jelep la into Tibet which before long took the shape of an armed expedition with the twin objectives of countering non-existent Russian intringue and opening up the land to an almost negligible Indian overland trade. For Britain, and the world he was to span another three decades and in a variety of fascinating roles: as father of the Karakoram exploration; an Everest enthusiast; a member of the Great Game elite; a devout Christian. Above all, a founder of the World Congress of Faiths. In the 1930s, he was sympathetic to the cause of Indian nationalism and, during a brief visit, deeply struck by "the fearfully keen and intelligent" Congresswallahs!

Not unexpectedly, a major part of this large and impressive study – a little over two-thirds of its volume – deals with the explorer and the Great Game imperial adventurer. And while not a few in this country would be interested in Younghusband's later preoccupations with the realm of the spirit, it is to his earlier career that many will doubtless turn.

Born at Murree (1863), now in Pakistan, Younghusband's upbringing had been Victorian in the best sense of the term: regular daily prayers inculcation of filial piety; and the veritable Sunday school. At 13, he went to Clifton College which had a traditional role of preparing boys for a career in the army; at 17, he was inducted into Sandhurst where Allenby and Sir Herbet Lawrence (later Haig's chief of staff) were his contemporaries. Two years later, Younghusband was to join the 1st Royal Dragoon Guards, then stationed at Meerut, as a subaltern.

On the premise that the next Russian move would be in the direction of Manchuria, Younghusband was able to persuade his somewhat unbelieving superiors that intelligence gathering there was an urgent necessity. In the event, a three-member mission (including Younghusband) spent a little over six months (May-December 1886) surveying the land. Sadly though, for all their labours, they had to conclude that there were "no signs of an immediate Russian threat" to this remote part of the Chinese empire!

Hardly had his Manchurian venture drawn to a close when Younghusband embarked on a singularly impossible journey across the Gobi – through Hami, Turfan and Kashgar – to Kashmir. Even though "all the terrible Vagueness and uncertainty of everything" impressed itself upon him, he was determined to blaze a trail. And did.

The crossing of the inhospitable, trackless Gobi was hazardous enough– " a succession of gravel ranges without any sign of life, animal or vegetable, and not a drop of water" – worse was in store. And this was the descent of the 19,000 ft Mustagh pass on the edge of K-2 which marks the watershed between India and central Asia. It was an amazing feat of physical daring, especially in that he and his men had no equipment worth the name. "Knotting turbans and reins for ropes" and hacking steps in the ice "with a pickaxe and trusting to a grip from frozen, bootless feet", Younghusband managed what the veteran Swedish explorer of these parts was to call "the most difficult and dangerous achievement in these mountains so far".

Younghusband's next two journeys – to Hunza and the Pamirs – were exercises in combating what was then rated a major threat to the Raj: the possibility of a Tsarist Russian invasion through the empty spaces of central Asia. The Chinese, then in the death throes of the long-lived Manchu empire, though resilient to a degree were yet finding it difficult to resist the Muscovites. Younghusband's three-fold objective was to plug in the secret pass through which the Kanjutis (a Kirghiz name for the people of Hunza) plundered the caravan route between Leh and Yarkand; seek out the skulking Grombchevsky, the Russian agent actively engaged in surveying these parts; and tame the Mir of Hunza whom the British were finding increasingly recalcitrant.

His success was limited. The Mir for one was not willing to change his ways; nor Grombchevsky cease his travels, in the short run at any rate. The above notwithstanding, Younghusband was presently able to persuade his masters to undertake a journey to the Pamirs, to investigate a gap between Afghanistan and the Chinese empire which could pose a danger to the security of the Indian frontier. In the event, his celebrated brush with a party of Cossacks headed by Colonel Yanov at Bozai Gumbuz that nearly brought the two empires to a clash of arms.

The centrepiece of the book, as of Younghusband's Indian career, was the expedition to Lhasa (1903-04). Conceived by Curzon, the overbearing imperial proconsul, its essential purpose was to unmask an imaginary conspiracy to take over Tibet's Dalai Lama under the Tsar's wings. And insofar as Chinese control over the country was conspicuous by its absence – professions to the contrary notwithstanding – the Raj feared for the worst.

Curzon who had met and known Younghusband long before he took over as governor general (1899) had little difficulty in choosing him as leader of the expedition. Both were rabid Russophobes and, as is well known, literally hijacked a weak and very reluctant British government into acquiescence. By blatant half-truths and deliberate distortions. In the event, a diplomatic mission originally intended to sort out some vague allegations of intrusion on the Sikkimese border and opening up a few trade marts inside Tibet ended up as an armed expedition to bring the Tibetan ruler to heel and expose his intrigues with the Russian Tsar.

It was a sad, sordid business. The 'hostile' Tibetan army was non-existent; Russian intrigue, pure figment of a fevered, if fertile imagination. And yet in the process, hundreds of Tibetan yokels, 'armed' with sticks and slings, and protected by amulets from their uncouth lamas were massacred in cold blood. Even as they offered uncompromising resistance to their un-invited, and unwelcome, guests. The end-result could never be in doubt: the 'victorious' British army marched into Lhasa and dictated terms of peace to a hastily constituted authority that it had managed to establish. For hot on the heels of Younghusband and his men, Tibet's Dalai Lama, both its spiritual as well as temporal ruler, had made good his escape.

Sadly for Curzon and his protege, the Lhasa adventure proved to be a disaster. The governor general, increasingly out of step with his political masters in Whitehall, soon found himself out of his job; Younghusband, who had exceeded if not deliberately disobeyed instructions, practically at a loose end. The Lhasa convention that he had so solemnly concluded was materially modified; the honour he had so covetously sought, flatly denied. His political career drew virtually to a close.

A word here on Younghusband's works which relate to his Indian career and on which the book under review has leaned heavily for its narrative. *The Heart of a Continent*, first published in London in 1896 – and which has since run into several editions – gives a fascinating account of Younghusband's travels in Manchuria, through the Gobi and down the Mustagh; the Tibet expedition is retailed in *India and Tibet* (1910) while the *Light of Experience* (1927) takes care, *inter alia*, of his journeys in Sinkiang and the Pamirs.

The last phase of Younghusband's life – he retired in 1912 after a brief stint as British resident in Kashmir – was taken up by a number of causes he now steadfastly owned. Above all, by mysticism and a spiritual quest for a world leader. In the process he spawned no end of societies to realise his dreams, and authored an un-ending stream of books – sadly not all of them listed by his biographer. Out of nearly a score and more, a few titles picked up at random may bear mention: *Life in the Stars* (1927); *The Coming Country: A Pre-Vision* (1928); *The Reign of God* (1930); *The Heart of Nature* (1931); *A Venture of Faith* (1937) And what proved to be his swan song, *The Wedding* (1942)

With growing spiritual attainments and some vague mystic experiences, Younghusband drew into his fold a variety of characters. The most intriguing, as revealed in this study, was an attractive young woman, Madeline Lees. Married, a mother of seven children and almost half his age, Madeline drew closer and closer – both physically and, no doubt, spiritually – to "my very own, my very dearest Sir Francis" and confessed to loving him "more and ever more my beloved one" Not that Younghusband did not return her outpourings:

> Oh! my Madeline, oh my precious precious Madeline, how can I bear the joy Oh! what a blessed, blessed time that was – to feel that you were always there, just at the end of the passage and that at any time we could go to each other And when we did go to each other Oh! what happiness we had – unbelievable!

In the event, Younghusband seriously revised his earlier plans to be buried in the Himalayas which had always fascinated him And wanted it to be close to Becon Hill; his resting place a shrine that "wd. commemorate our romance". The interesting part of this liaison was its passionate pursuit during the dark, stormy days of second world war (1940-42) when London and much of England was exposed to the relentless Nazi blitz.

Patrick French is English, a student of American literature and, at 27, remarkably young. The research and travel – in China, right up to the border in Sikkim, where Younghusband launched his expedition; and a number of places where he spent his years in India – that have gone into his first book are wellnigh exhaustive And must no doubt have been exhausting. There is hardly a source at the archival, or personal level, that has gone unnoticed. Or remained untouched French's language is crisp and the text well-honed; it is difficult to pinpoint any dull pages or passages. The clever juxtaposition of the author's personal impressions of men and places with those of Younghusband's in his own day makes for illuminating comparisons. And a much-needed update. All through the text embellished by two excellent maps and some rare photographs marking subsections in each chapter, sit scores of the seated Buddha. A replica no doubt of the present the Tibetan regent, Tri Rimpoche, gave Younghusband. And one he treasured most all through his years.

If one may end on a brief personal note. A little over four decades ago, fascinated by the mission to the land of the lama, this reviewer undertook a detailed study which apart from a research degree and a work published in London, brought him into close contact with Dame Eileen Younghusband, her father's daughter and indeed only surviving child. A formidable social activist, happily she was singularly receptive to all enquiries and gave me, *inter alia*, uninhibited access to all her father's papers and diaries then stacked in two huge sacks in her London flat. With a narrow field of interest, a thorough examination of this rich, almost virgin source material, was not called for. Today, with Dame Eileen no more, the sacks and their contents have found their way into the old India office, now British Library archives; their long postponed scrutiny by Patrick French yielding a remarkable study of the man behind the mission to holy Lhasa.

NEW BOOK FROM **MD** PUBLISHERS OF THE HUMANITIES NATURAL & SOCIAL SCIENCE

RENEWABLE AND NOVEL ENERGY SOURCES

By
S L Sah

1995, 160p, 8 plates, ill, maps, append, bib, index, 22x14 cm
ISBN 81-85880-82-4 Rs 225 00

This book covers all the renewable energy sources, like solar, tidal, wind, biomass, geothermal, and new sources, like hydrogen, cold fusion, space generator, alcohol. It also deals with energy conservation, energy planning and management and future energy options.

Recent Research on Widows in India

Workshop and Conference Report

Marty Chen
Jean Dreze

The concerns of widows cannot be dissociated from those of other single women, or indeed from those of women in general. Widows do experience special difficulties and deprivations, connected, inter alia, *with the restrictions that are imposed on their lifestyle and the persistence of negative social attitudes towards them.*

In the context of social science research, it is right to give attention to widowhood as a particular cause of deprivation. And, in the context of social action, it is right to organise and support widows in their specific demands (e g, relating to pensions, property rights and other entitlements). But this does not mean that action has to take the form of working for or with widows in isolation from other women.

The studies and personal testimonies summarised in this paper amply demonstrate that there are intimate links between the predicament of widows and a wide range of patriarchal institutions such as patrilineal inheritance, patrilocal residence and the gender division of labour. The cause of widows must be seen as an integral part of the broader battle against gender inequalities.

THIS paper presents the findings of two recent gatherings aimed at achieving better understanding of the social and economic condition of widows in India. The two gatherings were planned as complementary events. Both of them took place at the Indian Institute of Management, Bangalore, during the last week of March, 1994.[1] The first event was an informal workshop involving 35 widows from different parts of the country, as well as 10 women activists with some prior experience of working with widows and other single women. This informal workshop was followed by a conference which brought together about 65 activists, scholars and policy-makers who have worked on issues relating to widows. We shall refer to these two events as 'the workshop' and 'the conference', respectively.

The programme of these events was partly oriented by the findings of earlier studies undertaken by the two of us on the living conditions of widows in rural India.[2] One of these studies involved fieldwork in 14 villages of seven different states (two each in West Bengal, Bihar, Uttar Pradesh, Rajasthan, Kerala, Tamil Nadu, and Andhra Pradesh), co-ordinated by Marty Chen. Most of the widows who participated in the workshop came from these villages. Their testimonies, aside from being of immense value on their own, helped to ensure that the deliberations of the conference were informed by the perspective of widows themselves. Just as the findings and recommendations of the informal workshop were presented at the conference, the conclusions of the conference were also shared with the workshop participants. A summary of recommendations made by the conference and workshop participants can be found in Appendix.

What follows is a combined report on the workshop and the conference. A list of the papers presented at the conference can be found in the References at the end of this article. In some places, we have also drawn on earlier studies in order to bridge various gaps in the material made available by these recent events. To simplify the presentation, all the statistical material has been presented in Tables 1-12, prepared with Jackie Loh.

Workshop

The purpose of the three-day workshop was to bring together a group of widows (and grass roots women activists) to share problems, exchange experiences, voice demands, and possibly initiate a network of widows and activists concerned with the specific problems of widows. The 35 widows and 10 grass roots women activists who participated in the workshop came from nine states: Gujarat, Karnataka, and the seven states mentioned earlier. They formed a very diverse group in terms of age, caste, occupation, income, and related characteristics. Various participatory training methods were used to facilitate communication despite the barrier of language (nine languages were represented), including games, exercises and skits. The workshop covered a wide range of issues and concerns raised by the participants, including changes in women's identity and status with widowhood; images of good and bad women; taboos regarding the behaviour of widows; options, constraints, and choices regarding remarriage; living arrangements and sources of support; struggles by widows to secure their property rights; other actions taken by widows to assert their individual or collective rights; demands of the widows on society and on the government.

For many of the widows who participated in the workshop, this event was an entirely new experience. Many had never left their home district or state. Most were interacting for the first time with women who spoke different languages. All were sharing their personal experience of widowhood in a group meeting for the first time. Each made a spirited contribution to the discussion. What emerged from this gathering was a strong sense not only of common suffering but also of common strength. Clearly, each widow had negotiated the specific circumstances of her widowhood with dignity and courage, whether by taking up a job for the first time, by cultivating her own land, by educating her children, by fighting for her property rights, by establishing an independent household, or even by joining a local women's organisation.

During the first two days of the conference that followed the workshop, the workshop participants went on a study tour to Mysore, which included a visit to the Mysore branch office of Mahila Samakhya, a village-level meeting with groups of women from 10 villages organised by Mahila Samakhya, and sight-seeing in Mysore city.[3] The workshop participants returned in time to participate in the closing session of the conference, during which they presented their charter of demands. The following morning, they met together for one last time to hear the recommendations made by the conference participants and to join together in a very moving farewell ceremony.

At the end of that ceremony, all the participants stood in a circle holding a long chain of flowers symbolising sisterhood and joined in a joyful song celebrating spring and renewal. The chain of flowers was then cut into as many pieces as there were participants. Each participant tied a string of flowers on another participant. Then each participant spoke about what she would do after returning home. Some widows resolved to break the

taboos relating to their dress (by wearing forbidden items such as colourful bangles, colourful clothes, 'bindi' or 'kumkum'), and to encourage other widows to do the same; others said that they would speak to other widows, women, and their communities about the workshop, or participate more actively in the local panchayat meetings. As these pledges were being made, in a spontaneous gesture of solidarity some of the married women put their bracelets on the wrists of the widows and their bindis on the foreheads of the widows. The activists resolved to campaign against the use of pejorative terms for widows; to insist that widows should be invited to marriages and other ceremonies; to incorporate a focus on widows in their on-going work; to survey widows in their areas of operation; to help widows secure pensions; to help widows take up legal cases to defend their property rights, etc.

This informal workshop that preceded and ran parallel to the more formal conference achieved two immediate results. First, it began a process of transformation among the widows themselves. None of them had had the opportunity, at least since widowhood and perhaps since marriage, to talk at length with other women - much less to sing, dance, act, and laugh. The workshop made them aware of a real possibility of creating a new identity for themselves and a sisterhood with other widows. Second, the workshop served to place the personal experiences and concerns of widows at the centre of the conference that followed.

The workshop also helped to bring out what the experience of widowhood means to an Indian woman today. Several aspects of that experience were frequently mentioned by most participants, despite their widely different social and regional backgrounds. First, a woman who loses her husband has to readjust the entire basis of her life and work: who she lives with, how she earns her livelihood, whether she has access to her husband's property, etc. Second, the negotiations involved in these adjustments are typically much easier if she has adult sons and/or supportive parents and brothers. Third, most widows receive very little support from their in-laws. In fact, the relations with in-laws are often quite tense. Finally, the primary concerns of the widows who participated in this workshop were to have a house in their own name, a secure job or source of livelihood, education for their children, and – last but not least – a positive social image.

Outline of Conference

The three-day conference was organised into six half-day sessions, as follows.

The opening session of the conference attempted to provide a general overview of the economic and social condition of widows in India. After a short presentation on the significance of widowhood as a social issue (Jean Dreze), evidence was presented on the living arrangements, remarriage rates, occupations, property rights, and sources of support of widows (Marty Chen); on the relative mortality risk of widows and married women (P N Mari Bhat); on the relative economic insecurity of widows and other female heads of households (Shobha Jaishankar); and on the relationship between aging and widowhood (Leela Gulati).

The second session focused on the property rights of widows. The papers presented in this session dealt with male control over the property, production, and reproduction of widows in colonial Haryana (Prem Chowdhury); the property rights of widows under customary and modern law in Rajasthan (Shobha and Ramesh Nandwana); the property rights of widows under customary and modern law in Bihar (Seema Misra and Enakshi Tukral); and the difficulties faced by many widows when they try to claim their rights to property (Neelam Ghore).

The third session examined issues of social security. The contributors discussed the measures that can be introduced to provide economic and social security to widows (S Guhan); the coverage of widows under three pension schemes in Kerala (Iqbal and Leela Gulati); the bureaucratic hurdles widows face in obtaining a pension in Tamil Nadu (Eswara Prasad); the social insecurity of widows in rural Gujarat (Varsha Bhagat and Mihir Bhatt); and the coverage of widows under a comprehensive insurance scheme for women established by SEWA (Reema Nanavaty).

The fourth session focused on employment and livelihood. Presentations were made on the economic situation of widows and widow-headed households in Kerala (Leela Gulati); on the relationship between widowhood and poverty in India as a whole (Jackie Loh, Jean Dreze and P V Srinivasan); on women's occupations by marital status in Haryana (D V Rukmini); on working class widows in Bombay (Alice Thorner); on self-employed widows in Gujarat (Renana Jhabvala); on widows who work as domestic servants (Siddama); and on widows who work as construction workers (Geeta Ramakrishnan).

The fifth session dealt with the status of widows in society. It included a sociological analysis of widowhood as 'social death' (Uma Chakravarty), a comparative perspective on widows and other single women (Abha Bhaiya), and different accounts of public initiatives to 'rehabilitate' widows – by the state after partition (Ritu Menon), and by social movements in Gujarat, Rajasthan, and Karnataka (Bela Bhatia, Chandra Bhandari, and Uma Kulkarni).

The closing session opened with a set of recommendations for future action, policy, and research from the conference participants, and concluded with a charter of demands from the widows who had attended the earlier workshop (see Appendix I).

In the rest of this paper, we present a short summary of the presentations made in each session of the conference.

Widows in India

The intention of the opening session of the conference was to propose a framework for approaching the issue of widowhood in India, and to provide background information that should help inform and focus the conference deliberations. Given the scope and importance of the opening session, the presentations made in this session will be covered here in some detail.[4]

Incidence of widowhood

According to recent information released by the Sample Registration System, widows represent a little over 8 per cent of the female population.[5] Census data on the incidence of widowhood, as measured by the proportion of widows in the female population, reveals the following patterns. First, the incidence of widowhood has been slowly declining over time during the last few decades. This can be primarily attributed to the concurrent expansion of male and female longevity.[6] Second, the incidence of widowhood is lower in most of the northern states than in south India. This can be attributed to several factors, including strong survival advantages of adult females (compared with adult males) in the south; a large difference between male and female age at marriage in the south; comparatively high remarriage rates in the north; and high mortality rates among north Indian widows. Third, the incidence of widowhood rises sharply with age. The proportion of widows is as high as 64 per cent among women aged 60 and above, and 80 per cent among women aged 70 and above (Table 2). In other words, an Indian woman who survives to old age is almost certain to become a widow. Fourth, the high incidence of widowhood among women (particularly in the older age groups) sharply contrasts with the corresponding patterns for males. In 1991, only 2.5 per cent of all Indian men were widowers [Government of India 1993:71]. Even in the older age groups, only a small minority of men are widowed, while a large majority of women experience that predicament. The main reason for this gender gap in the incidence of widowhood is a much higher rate of remarriage among widowed men, compared with widowed women.

The last observation may help to explain why widowhood has received so little attention as a cause of deprivation. In India, the experience of losing one's spouse is, overwhelmingly, a female experience. Further, the consequences of losing one's spouse are very different for men and women.

A widower not only has greater freedom to remarry than his female counterpart, he also has more extensive property rights, wider opportunities for remunerative employment, and a more authoritative claim on economic support from his children. Had the living conditions of widowers been as precarious as those of widows, it is likely that widowed persons would have attracted far more attention.

Widowhood and poverty

There are serious difficulties in assessing the relationship between widowhood and poverty on the basis of standard household survey data. Indeed, much of the information generated by these surveys relates to household level variables that often tell us very little about what is happening to widows as individuals. For instance, it is hard to make effective use of the standard data on *per capita* income or expenditure to investigate the relationship between poverty and widowhood.

These limitations were illustrated at the conference in a study by Jean Dreze and P V Srinivasan. Using the National Sample Survey data, the authors find that there is little difference in *per capita* expenditure between, say, households headed by widows and other households. Nor is the proportion of households below the poverty line much higher than average among households headed by widows. In interpreting these findings, however, it has to be remembered that households headed by widows have special demographic characteristics. In particular, they are typically much smaller than other households. Hence, if there are economies of scale in household consumption, the rank of these households in the scale of real *per capita* expenditure declines. The authors showed that even relatively small economies of scale lead to a dramatic increase in the relative incidence of poverty among households headed by widows, compared with other households.

These findings are somewhat inconclusive, since little is known about the actual magnitude of economies of scale in household consumption in rural India. Further, as was mentioned earlier, household level data tell us little about the well-being of widows as individuals. Given these limitations of standard household surveys, it is important to explore other indicators of the individual well-being of widows, e.g. relating to nutrition and morbidity. A useful example of the possibility of using such indicators was provided by P N Mari Bhat's study of mortality rates among widows.

Widowhood and survival

Using data from the 1961, 1971 and 1981 censuses, Mari Bhat estimated mortality rates among widows and married women of the same age, in the 45 age group. For India as a whole, the author finds that mortality rates are 86 per cent higher among widows than among married women (see Table 3 for the main results). These results confirm the notion that widows in India experience particularly high levels of deprivation.

It should be mentioned that, according to the same study, the mortality rates of *widowers* are also about 80 per cent higher than those of married men in the same age group. This may seem to suggest that men suffer as much as women from losing a spouse, in terms of increased mortality.[7] On this point, several remarks are due. First, the standard pattern observed in similar studies undertaken in other countries is that the increase of mortality risk associated with losing one's spouse is *larger* among men than among women. In relation to this international pattern, Indian widows are at

TABLE 1: INCIDENCE OF WIDOWHOOD IN RURAL AREAS – INTER-SATE CONTRASTS, 1981

State	Widow as Percentage of Rural Female Population	Ratio of Widows to Widowers in Rural Population	Proportion of Rural Indian Widows living in State (Percentage)	Average age Differential at Marriage Years[a]
Andhra Pradesh	10.5	4.3	10.5	5.7
Tamil Nadu	10.4	3.9	8.2	5.8
Karnataka	9.9	4.6	6.4	6.7
West Bengal	9.5	6.0	9.1	6.5
Maharashtra	9.3	4.4	9.3	5.4
Orissa	9.2	3.7	5.3	5.1
Kerala	8.9	7.7	4.6	5.5
Madhya Pradesh	8.0	2.6	8.0	4.0
Himachal Pradesh	7.7	2.5	0.8	4.7
Bihar	7.5	2.5	11.1	4.9
Rajasthan	7.2	2.4	4.6	4.2
Gujarat	7.0	2.9	4.0	3.6
Uttar Pradesh	6.5	1.4	13.8	4.3
Jammu and Kashmir	5.7	1.4	0.6	5.0
Punjab	5.5	1.6	1.5	3.3
Haryana	4.9	1.5	1.1	3.9
India[b]	8.2	2.9	100.0	5.0

Notes: [a] Difference between the mean age at marriage of males and females (rural and urban areas combined).

[b] Excluding Assam, where the 1981 census was not conducted.

Source: Dreze (1990), Table 6, based on 1981 census data. The states are arranged in decreasing order of the proportion of widows in the rural female population.

Note: The tables included in this paper are, a selection of tables compiled with Jackie Loh from the conference papers. Some of the information has already appeared in earlier publications (as indicated in the notes). The intention is both to provide a short statistical background on the situation of widows in India and to highlight interesting empirical observations reported at the conference.

TABLE 2: INCIDENCE OF WIDOWHOOD IN DIFFERENT AGE GROUPS AND REGIONS, 1981

Age Group	Widows as Percentage of All Rural Females in the Specified Age Group and Region				
	North-West	Central West	East	South	All India[a]
0-9	0.0	0.0	0.0	0.0	0.0 (0.0)
10-14	0.04	0.04	0.03	0.03	0.03 (0.03)
15-19	0.2	0.3	0.3	0.2	0.2 (0.1)
20-24	0.5	0.7	0.9	0.9	0.7 (0.5)
25-29	1.0	1.5	2.0	2.0	1.6 (1.0)
30-34	2.1	2.9	3.6	4.3	3.2 (1.6)
35-39	3.6	5.0	6.3	7.0	5.5 (2.3)
40-44	7.9	9.6	12.3	13.7	10.8 (3.8)

60-64	48.7	55.3	58.1	61.3	55.6 (14.9)
65-69	44.0	59.8	61.5	66.8	57.6 (17.8)
70+	70.5	78.4	78.3	83.4	77.2 (27.8)
All ages	6.5	8.3	8.5	10.0	8.2 (2.7)

Note: [a] In brackets, the corresponding figures for *males*.

Source: Dreze (1990), Table 5, based on 1981 census data. The different regions have been defined as follows. North-west: Haryana, Himachal Pradesh, Jammu and Kashmir, Punjab, Rajasthan, Uttar Pradesh; Central west: Gujarat, Maharashtra, Madhya Pradesh; East: Bihar, Orissa and West Bengal; South: Andhra Pradesh, Karnataka, Kerala and Tamil Nadu. This regional division is based on Agarwal (1988).

some disadvantage. Second, the results have to be interpreted bearing in mind the very high remarriage rate among Indian men who have lost their spouse. Among the small minority of widowed men who do *not* remarry, many are likely to suffer from special economic, social or physical disadvantages that make remarriage difficult. It is perhaps not surprising that, in this subsample, mortality rates are particularly high, but this does not imply that mortality rates are particularly high among all *ever-widowed* men (including those who have remarried).

Third, the case for being concerned about Indian widows does not turn on their being *more* deprived, in terms of mortality and related indicators, than widowers who do not remarry. Even if the two groups are equally deprived in some respects, there would still be a case for paying separate attention to the issue of widowhood among women, given (1) the much higher incidence of widowhood among women than among men (and, relatedly, the much greater freedom that widowed men have to remarry), and (2) the social and psychological deprivations endured by many widows, in addition to economic hardship.

The study by Mari Bhat also brings out some interesting regional patterns in mortality rates. Specifically, the gap in mortality rates between widows and married women appears to be much larger in many of the northern states (including Punjab, Haryana, Uttar Pradesh and Bihar) than in south India. This is in line with the findings of earlier studies, suggesting that the economic and social condition of widows is particularly unfavourable in north India.[8]

Sources of vulnerability

In earlier studies we have identified some essential factors that account for high levels of deprivation among Indian widows [Dreze 1990; Chen and Dreze 1992]. These include limited freedom to remarry, insecure property rights, social restrictions on living arrangements, restricted employment opportunities and lack of social support. In her presentation at the conference, Marty Chen used the framework developed in these earlier studies to present the major findings of her study, based on a field survey in 14 villages of West Bengal, Bihar, Uttar Pradesh, Rajasthan, Kerala, Tamil Nadu, and Andhra Pradesh. This survey covered a total of 562 respondents. These 562 respondents consisted of *all* 'ever-widowed' women in the 14 survey villages, including widows who had remarried. More precisely, the 562 respondents consisted of: (1) 510 women who had lost their husbands and did *not* remarry, (2) 35 women who had lost their husbands, remarried, and then became widowed again by losing their second husbands; and (3) 17 women who had lost their husbands, remarried, and were still married at the time of the survey.[9]

Patrilocality: The system of patrilocal residence, which has the effect of isolating women, is a fundamental source of gender inequalities in many parts of rural India and also plays a crucial part in the deprivation of widows. Patrilocality in the narrow sense refers to the norm, prevalent in most Hindu communities of India, according to which a woman has to leave her parental home at the time of marriage to join her husband in his home. In a broader sense, especially in most Hindu communities of north India where marriage rules dictate marriage outside the clan and village, patrilocality also can be understood to refer to the drastic alienation from her parental family experienced by a married woman after her 'transfer' to her husband's family.

TABLE 3: MORTALITY AND WIDOWHOOD

State	Estimates of the Relative Mortality Rates of Widowed and Married Persons (Ratio of the Mortality Rate of the First Group to that of the Second Group), in the 45 + Age Group			
	Females		Males	
	1961-71	1971-81	1961-71	1971-81
Andhra Pradesh	1 51	1 74	1 78	2 03

Source: Mari Bhat (1994), Table 4, based on census data. The figures in this table refer to the ratio of the mortality rate among widowed persons aged 45+ to that of married persons in the same age group. The estimation method takes into account the different age structures of the widowed and married populations and avoids the bias that might arise from this difference.

TABLE 4: WIDOWHOOD AND LIVING ARRANGEMENTS
'Relation to Household Head' of Widows in Different Samples

Relation to Head	Number of Widows with the Specified Relation to Household Head					
	Bose and Saxena[a] (1964)	Bose and Sen (1966)	Lal (1972)	Cain et al (1979)	Harlan[a] (1968)	Chen (1994)
Self	1	*	1	20	4	342
Mother[b]	242	305	71	41	13	136
Daughter	*	5	2	2	0	17
Sister	*	2	3	1	0	9
Mother-in-law	*	*	*	3	1	9
Daughter-in-law	*	4	1	1	0	8
Sister-in-law	*	20	3	2	0	8
'Other' relative[c]	16	12	7	0	0	14
Non-relative	0	1	0	0	0	2
Total	259	349	88	70	18	545

Notes: [a] Elderly widows only (aged 55+ in the case of Bose and Saxena, and 50+ for Harlan).
[b] When a widow is the mother of the head, the latter is usually a son rather than a daughter.
[c] 'Other' is relative to the categories used in the respective studies; the content of this category can be inferred, *study-wise*, from the other entries in the table.
* Category not used in the presentation of the results (but note that it could be implicit in the 'other relative' category).

Source: Dreze (1990), Tables 23 and 24, Chen and Dreze (1992), Table 10, and Chen (1994). The figures were originally compiled from: (i) Bose and Saxena (1964), based on a random sample of 259 widows aged 55+ from 78 villages in Rajasthan; (ii) Bose and Sen (1966), based on a random sample of 349 widows from villages in Rajasthan; (iii) Lal (1972), based on a sample of 88 widows in three panchayats in Rajasthan; (iv) Cain et al (1979), based on a census of village Char Gopalpur in Bangladesh, (v) Harlan (1968), based on a census of elderly women in a village in Punjab; (vi) Chen (1994), based on a 1991-92 study of 562 ever-widowed women in 14 villages spread over seven different Indian states (the above figures derived from this study are actually based on a sub-sample of 545 currently-widowed women).

In the Chen sample, 75 per cent of the widows lived in their husband's village at the time of his death. Of these widows, an overwhelming majority (88 per cent) remained in their deceased husband's village after his death (Table 5). In many cases, widows actually continue to live in their deceased husband's house. However, outside of leviratic unions (which are practised only in certain communities), widows are unlikely to share a common hearth with their husband's relatives. Indeed, in the Chen sample, whereas 10 per cent of the widows shared a common hearth with their in-laws before their husband's death, only 3 per cent currently share a common hearth with their in-laws (either brothers-in-law or parents-in-law). And, in many cases where a widow does share a common hearth with a parent-in-law, it is the widow who seems to be supporting the in-laws (e g, a blind mother-in-law or disabled father-in-law) rather than the reverse.

Patrilineal inheritance: A comprehensive treatment of the inheritance rights of widows would have to distinguish: (a) between statutory law, customary law, and actual practice; (b) between the inheritance rights of widowed women as daughters and as widows; (c) between ancestral and self-acquired property; and (d) between land and other property. Despite these complexities, what seems clear is that most social groups in rural India follow customary law rather than statutory law and that, under the current customary practices of most patrilineal Hindu communities, women have very limited property rights as daughters but are widely acknowledged to have use rights to (or maintenance rights from) a share of their husband's ancestral land in the event of his death.

As part of her study of widows, Marty Chen investigated actual inheritance practices in the study villages and found the following patterns: first, of those widows whose husband owned land, 51 per cent reported that they exercise use rights over a share of their husband's land; and second, of those widows whose father (father or mother, in the case of Kerala) owned land, 13 per cent reported that they exercise use rights over a share of their father's (mother's) land. However, these use rights of widows are often violated in practice. When a widow tries to manage the land on her own, without adult sons, her brothers-in-law often insist on sharecropping or managing her land themselves, or simply attempt to deprive her of her rightful share of the land (often legitimising their claim by arguing that they spent money on her husband's death ceremony or on her children's maintenance). In their attempt to gain control of her land, the brothers-in-law of a widow may go so far as forcing her to leave the village, or even – in extreme cases – arranging her murder.[10] Once her sons (if any) grow up, a widow may have to forfeit her use rights to her husband's land in exchange for a right to maintenance by one or more of her sons. Even maintenance rights, however, are often uncertain.

Remarriage practices: Two stereotypes persist about widow remarriage in India. The first is that widow remarriage is "prohibited" in Hindu society. The second is that widow remarriage is widely practised. Reality lies somewhere between these two extreme views: only the upper castes prohibit remarriage; most other castes (except those emulating the upper castes) allow widow remarriage; some castes (in certain regions) practice leviratic unions (remarriage to the deceased husband's brother); but actual remarriage, outside of levirate, only takes place in special circumstances. The basic pattern in most communities is that most childless widows remarry, while most widowed mothers do not remarry.

In the Chen sample of 562 ever-widowed women, 13 per cent in north India had remarried, compared with only 6 per cent in south India. These figures are consistent with the findings of earlier studies [Dreze 1990, and the studies cited there]. The lower probability of remarriage in the south is due in part to the practice of levirate in the north: the only villages of the Chen study where levirate was widely practised was situated in the Garhwal hills of Uttar Pradesh. In the Chen sample of 52 remarried widows (of which 35 lost their second husband also), 24 were from scheduled castes, 22 from backward castes, and only six from upper castes (all six were rajputs or brahmins from the Garhwal hills who practise both levirate and widow remarriage in general).

Among the widows covered in the Chen sample, as well as among those who participated in the Bangalore workshop, many stated that they did not wish to remarry. Common reasons given for not wanting to remarry included: absence of desire for more children, fear that a second husband will not take good care of the children fathered by the first husband, and wish to retain claim on the deceased husband's land (bearing in mind that widows lose this claim on remarriage). Of course, the fact that many

TABLE 6: PLACE OF RESIDENCE BEFORE AND AFTER WIDOWHOOD

(Percentage)

Place of Residence	Before	'Now'*
Deceased husband's village	75	67
Parental village	21	27
Other village	5	6

Note: * 'Now' refers to the situation at the time of the survey (1991-92).

Source: Chen (1994), based on a 1991-92 survey of 562 ever-widowed women in 14 Indian villages (two each in West Bengal, Bihar, Uttar Pradesh, Rajasthan, Andhra Pradesh, Tamil Nadu and Kerala). The figures presented here are based on the sub-sample of 510 widows who did not remarry. In the few cases where a widow's parental village is also her husband's village, she has been counted as living in her parental village.

TABLE 5: SELECTED NORTH-SOUTH CONTRASTS
Place of Residence, Land Rights, Remarriage and Living Arrangements

(Percentage)

parents or brothers	3	6	4

Note. * Parental land = father's ancestral land in all states except Kerala, where it also includes mother's ancestral land.

Source: Chen (1994), based on a 1991-92 study of 562 ever-widowed women (of which 17 are currently-remarried) in 14 villages in north India (two each in West Bengal, Bihar, Uttar Pradesh, Rajasthan, Andhra Pradesh, Tamil Nadu and Kerala). 'Place of residence' and 'use rights' percentages are based on a sub-sample of 510 widows who did not remarry; 'remarriage' percentages are based on the full sample; and 'living arrangements' percentages are based on a sub-sample of 545 currently-widowed women (of which 510 did not remarry, and 35 remarried but lost their second husband).

RESERVE BANK OF INDIA SERVICES BOARD
BOMBAY

TELEGRAPHIC ADDRESS: SERVBOARD BOMBAY

Applications (Apps.) are invited for the following posts of Officers in Reserve Bank of India. 'Reserve List' may also be prepared.

A. LEGAL OFFICER IN GR.'B' IN LEGAL DEPARTMENT

a) **Vacancies :**

	G	OBC	SC	ST	Total	
Regular	3	1	1	–	5	7
Backlog	–	–	1	1	2	

b) **Qualifications** (As on 01.10.1995)

Essential : Second Class Bachelor's Degree in Law* with a minimum of 50% marks (45% for SC/ST) or equivalent.

Desirable : i) Bachelor's Degree in Law with First Class or Master's Degree in Law* or equivalent.
ii) Computer Applications.

** from a recognised University / Institute.*

c) **Experience** (As on 01.10.1995)

Essential : At least 2 years' experience as an Advocate or as a Law Officer in Legal Department of a large Banking / Financial Institution and/or as a Lawyer in an Advocate's /Solicitor's Office.

Desirable : Special knowledge of Banking and Company Laws, Labour Laws, Constitutional Law and experience in documentation.

d) **Age** (As on 01.10.1995)

Not exceeding 32 years. Relaxable by 3 years for possessing exceptional qualifications and/or experience of value to the Bank.

Scheme of Selection

Written examination (WE) on **10-12-95** . Two descriptive type papers, each of 3 hours duration and 100 marks on (i) General Knowledge of Law, Jurisprudence etc. and (ii) Commercial and Banking Laws. Syllabus given in detailed advertisement.

B. RESEARCH OFFICER IN GR.'B' IN DEPARTMENT OF ECONOMIC ANALYSIS AND POLICY (DEAP)

a) **Vacancies :**

	G	OBC	SC	ST	Total	
Regular	5	2	1	1	9	12
Backlog	–	1	1	1	3	

b) **Qualifications** (As on 01.10.1995)

Essential : Master's Degree in Economics/Econometrics/ Commerce* with a minimum of 55% marks (50% for SC/ST) or equivalent grade.

Desirable : i) Candidates with Doctorate Degree in above subjects* will be given preference.
ii) Research or teaching experience and publication in standard journals will be considered as an additional qualification.

c) **Age limit** (As on 01.10.1995) : 21 - 28 years

i) Candidates having M.Phil.Degree / Doctorate Degree in specified subjects* eligible for relaxation in upper age by 3 and 5 years, respectively.

ii) Candidates with research/teaching experience* eligible for relaxation in upper age upto years of experience (maximum 5 years).

No cumulative age relaxation available.

** from / at recognised Indian or Foreign University/Instt.*

d) **Scheme of Selection :**

Written examination on **7.1.96.** Two papers each of 3 hours duration and 100 marks - (i) Objective and (ii) Descriptive (both on Economics). Standard of papers that of Master's Degree examination in Economics of any Central University in India.

C. RESEARCH OFFICER IN GR.'B' IN DEPARTMENT OF STATISTICAL ANALYSIS AND COMPUTER SERVICES (DESACS)

a) **Vacancies :**

	G	OBC	SC	ST	Total	
Regular	9	5	2	1	17	20
Backlog	–	–	2	1	3	

b) **Qualifications** (As on 01.10.1995)

Essential : i) Master's Degree in Statistics/Mathematical Statistics/Mathematical Economics/Econometrics* with a minimum of 55% marks (50% for SC/ST) or equivalent grade; **OR**

ii) Master's Degree in Mathematics* with a minimum of 55% marks (50% for SC/ST) or equivalent grade and one year Post-Graduate Diploma in Statistics or related subjects from an Institute of repute; **OR**

iii) M.Stat.Degree of Indian Statistical Institute with a minimum of 55% marks (50% for SC/ST).

Desirable : (i) Candidates with Doctorate in subjects as at (i) above* will be given preference.

(ii) Research or teaching experience and publication in standard journals will be considered as an additional qualification.

c) **Age limit** (As on 01.10.1995) : 21 - 28 years.

B (c) to apply, mutatis mutandis.

** from / at recognised Indian or Foreign University / Instt.*

d) **Scheme of Selection**

Written examination on **14.1.96.** Two papers each of 3 hours duration and 100 marks - (i) Objective and (ii) Descriptive (both on Statistics) as per syllabus given in detailed advertisement. Standard of papers that of Master's Degree examination of any Central University in India.

D. MINIMUM PASSING STANDARDS

(i) 55% in each paper and 60% in the aggregate for General category, and

(ii) 45% in each paper and 50% in the aggregate for SC/ST/OBC categories.

However, the Board reserves the right for relaxation of the minimum passing standards.

E. AGE RELAXATIONS :

5 years for SC/ST, 3 years for OBC, 5 years to the candidates who had ordinarily been domiciled in the Kashmir Division of the State of Jammu & Kashmir during the period from 1st January, 1980 to 31st December, 1989, Refer detailed advertisement for others.

F. FINAL SELECTION :

Will be based on Written Examination and Interview.

RESERVE BANK OF INDIA SERVICES BOARD, BOMBAY

G. EXAMINATION CENTRES :

(Code numbers in brackets)

Ahmedabad	(11)	Jaipur	(20)
Bangalore	(12)	Jammu	(21)
Bhopal	(13)	Kanpur	(22)
Bhubaneswar	(14)	Madras	(25)
Bombay	(15)	Nagpur	(26)
Calcutta	(16)	New Delhi	(27)
Chandigarh	(17)	Patna	(29)
Guwahati	(18)	Thiruvanantapuram	(31).
Hyderabad	(19)		

Only one centre can be selected.

H. APPLICATION FEE :

Rs.50/-. (No fees for SC/ST). Payable **by Demand Draft** favouring RBI payable at Bombay. However, candidates from unbanked areas may send crossed Indian Postal Order in favour of RBI payable at GPO, Bombay. **Fee not refundable.**

I. SERVICE CONDITIONS/CAREER PROSPECTS

Pay Scale - **Rs.2400-5175** (under revision). Initial monthly emoluments will be about **Rs.6645/-** .

J. HOW TO APPLY

Applications in **prescribed format** given herewith, typed or neatly handwritten in English or Hindi on white foolscap paper, should be addressed to :

THE GENERAL MANAGER,
RBI SERVICES BOARD,
HONGKONG BANK BUILDING, 6TH FLOOR,
M.G. ROAD, HUTATMA CHOWK,
POST BAG NO. 10009, BOMBAY-400023.

Cover should be superscribed: "Application for the post of _____- Centre of Written Examination chosen _____ Code No. _____". Should be sent by **ORDINARY POST**. Cover may also be dropped in a special box at Board's Office.

K. CLOSING DATE

4.11.95 (18.11.95 for applicants residing abroad, in Assam, Arunachal Pradesh, Manipur, Meghalaya, Mizoram, Nagaland, Sikkim, Tripura, Ladakh division of Jammu and Kashmir State, Lahaul and Spiti districts and Pangi Sub-division of Chamba district of Himachal Pradesh and in Andaman and Nicobar Islands and Lakshadweep). **Late received Appns. will not be considered.**

L. GENERAL INSTRUCTIONS

(i) Question Papers will be set in Hindi and English and answers may be written either in Hindi or in English.

(ii) If Admission Letter (AL) / any other communication is not received from Board, contact RBI at respective examination centre with a passport-size signed photograph, one day before the date of WE.

(iii) Communicate change of address to Board earliest.

(iv) Incomplete / without fee Appns. will not be considered.

(v) If App. is routed through employer 'Advance Copy' with fee should be sent to Board's Office directly.

(vi) Quote Roll No. in all communications.

Note : For staff candidates, separate eligibility criteria laid down by Bank.

M. FOR FULL DETAILS, REFER DETAILED ADVERTISEMENT PUBLISHED IN EMPLOYMENT NEWS / ROZGAR SAMACHAR DATED 7TH OCTOBER, 1995.

CANVASSING IN ANY FORM WILL BE A DISQUALIFICATION

FORMAT OF APPLICATION

LAST DATE OF RECEIPT: 4.11.95

In case of non-receipt of AL contact Chief General Manager, Reserve Bank of India of respective centre one day before WE.

RESERVE BANK OF INDIA SERVICES BOARD, BOMBAY

ADVT NO 2/95-96

Signature of applicant

widows express little interest in remarrying needs to be interpreted bearing in mind not only the influence of negative social attitudes towards widow remarriage, but also the low chance of conjugal happiness in a second marriage. Indeed, given the prevailing social attitudes, a man who agrees to marry a widow often has highly unattractive characteristics (e g, he may be very old, or physically disabled, or economically impoverished, or looking for a second wife). The issue of widow remarriage in India is not just a question of the incidence of remarriage, but also of the quality of second marriages, and of the freedom widows have to remarry in positive circumstances.[11]

Employment restrictions: Indian women in general face well known restrictions on employment opportunities, relating, *inter alia*, to the gender division of labour. Aside from these general restrictions, widows face specific difficulties in seeking gainful employment opportunities. These include: lack of access to indivisible productive assets owned by the deceased husband's family (e g, wells, ploughs and bullocks); weak bargaining power *vis-a-vis* male partners in economic transactions; frequent absence of a literate member in the household; limited access to institutional credit; and, particularly in the case of widows with young children, the burden of domestic work.

An analysis of the primary occupations of households with widows in the Chen sample shows a decline in the share of self-employment - both farm and non-farm - after widowhood (from 25 per cent to 20 per cent), and, correspondingly, an increased reliance on wage employment (from 32 per cent to 36 per cent). The limited extent of remunerative non-farm self-employment among widows, even those living in households without an adult male, is particularly striking. The restricted scope for remunerative self-employment is a particular problem for widows belonging to castes that prohibit women from seeking wage employment, especially if they live without an adult male. As expected, employment opportunities were found to be somewhat more extensive and diverse for widows belonging to disadvantaged castes. The fact that, for a widow, belonging to a privileged caste can be a disadvantage (other things being equal) reminds us that it is always important to consider widows as individuals, and not as members of particular castes, classes or other social groups.

Maintenance: The restrictions on residence, ownership, remarriage and employment examined so far put widows in a situation of acute dependence on economic support from others. In the absence of effective forms of state-based social security measures, family and community support or maintenance is the crucial source of potential assistance. The extent and nature of family and community support can be analysed in terms of three determinants: living arrangements; intra-household support; and inter-household support.

As far as living arrangements are concerned, one of the clearest and most important findings of Chen's and other studies is the overwhelming dependence of widows on themselves and their own sons. The proportion of widows who live in households headed either by themselves or by one of their sons is well over 85 per cent in the Chen sample. The proportion of widows who live in a household headed by a brother-in-law or parent-in-law is below 3 per cent, and the number of widows who live in a household headed by a brother or father is also below 3 per cent. These findings are consistent with those of earlier studies, also pointing to the overwhelming dependence of Indian widows on themselves and their own sons [Dreze 1990, and Chen and Dreze 1992, for reviews of the evidence].

In terms of both intra- and inter-household support, few widows report regular support (as opposed to periodic gifts or support during crises) from persons other than sons. In the Chen sample, very few widows reported regular support from their in-laws; many widows reported periodic gifts or support during crises from brothers (and parents) but few (less than 10 per cent) reported regular support from these sources; many widows reported that their daughters provided various physical services (e g, health care or house repair), and a surprisingly high percentage of widows (16 per cent) reported regular support from daughters; and many widows reported exchanges in kind from caste neighbours and small gifts (or occasional loans) from wealthy employers.

Social isolation: As was mentioned earlier, the well-being of widows is not just a question of economic security, but also one of dignity, self-respect and participation in society. Many widows in the Chen sample suffered from different forms of social isolation, psychological abuse or emotional distress. The social marginalisation of widows was frequently found to take one or more of the following forms:

(1) Rumours and accusations: widows are often accused of being 'responsible' for their husbands' deaths, regarded as sexually threatening, and generally considered as inauspicious.

(2) Enforced dress and behaviour codes: many widows are under strong pressure to observe restrictive codes of dress, appearance and behaviour. Some of the traditional restrictions (e g, shaving of head) have become quite rare, even among the upper castes, but others (e g, not wearing 'bindi' or kumkum) remain widespread.

(3) Social ostracism: a widow is often excluded from the religious and social life of the community, due to her perceived inauspiciousness.

(4) Physical violence: violence against widows primarily takes the form of sexual harassment (young widows being considered

TABLE 7: FEMALE-HEADED HOUSEHOLDS BY MARITAL AND EMPLOYMENT STATUS OF THE HOUSEHOLD HEAD

Marital Status of the Household Head	Percentage Distribution of Household Heads by Employment Status						
	Self-Employed (Agri)	Self-Employed (Non-Agri)	Regular Hired Labour in Agri	Regular Hired Labour in Agri	Casual Labour	Attending Domestic Duties	Too Old Too Young and Others
Widowed	18	5	25	9	7	21	15
Married	35	3	14	2	5	26	15

Source: Adapted from Jaishankar (1994), Tables 10-19, based on a 1983 survey of 428 female-headed households (271 of which were widow-headed) from 10 villages (four each in West Bengal and Karnataka, and two in Uttar Pradesh)

TABLE 8: CONTRASTS BETWEEN DIFFERENT CASTES
Remarriage and Employment

Self-employment (animal husb)	14	6	7	3
Self-employment (non-farm)	10	15	18	14
Wage labour	8	11	26	56

Note: * Levirate among Rajputs in the UP hills.

Source: Chen (1994), based on a 1991-92 survey of 562 ever-widowed women in 14 villages (two each in West Bengal, Bihar, Uttar Pradesh, Rajasthan, Andhra Pradesh, Tamil Nadu and Kerala). The percentages on remarriage are based on the full sample; the percentages on employment are based on a sub-sample of 545 currently-widowed women. As some widows reported more than one activity and some reported none, the percentages do not add up to 100.

as sexually vulnerable and/or promiscuous) or property-related violence (because widows are seen as unwanted claimants on ancestral property).

Of course, not all widows face these types of mistreatment. Many older widows who live with their sons (and their families) enjoy their respect and love. Some older widows are happily integrated in their daughters' households. It is young widows who are most vulnerable to mistreatment, unless they have the support of their parents or brothers.

Regional contrasts

North-south contrasts in gender relations within India have been much discussed in the literature, and it is not surprising that these contrasts have an influence on the living conditions of widows.

One aspect of these contrasts concerns the kinship system, and, in particular, the relationship of a married woman with her parental family after marriage.[12] In most communities in north India, marriage practices dictate not only patrilocal residence upon marriage but also clan exogamy (marriage outside the clan) and village exogamy (marriage outside the village); so that a woman has to leave her parental lineage, home, and village upon marriage. This system has the effect of isolating and dispossessing women, and also plays a crucial part in the deprivation of widows. In many communities in south India, the marriage system is based on patrilocal residence but also involves a preference for marriage within the kinship group (which can often lead to marriage within the village); so that a woman may not have to leave either her parental lineage or her natal village upon marriage.

It is plausible that this basic difference in kinship systems tends to give widows in south India greater freedom than their north Indian counterparts to return to their parental village, to claim ownership rights on their father's land, to claim ownership rights on their deceased husband's land, and to take up productive employment. The data from the Chen study confirm these hypotheses:

(1) Residence in natal village: The percentage of widows living in their natal or parental villages is significantly higher in south India (43 per cent) than in north India (11 per cent). And, interestingly, of those currently living in their natal village in south India, most (80 per cent) also lived there before their husband's death. In north India, of those currently living in their natal village, just over half (55 per cent) lived there before their husbands' death.

(2) Claim to share of father's land: The percentage of all widows who have inherited land from their father is higher in south India (18 per cent) than in north India (8 per cent).

(3) Claim to share of husband's land: Of those widows whose husbands owned land, 52 per cent in south India reported that they exercise use rights over a share of their husband's land, compared with only 51 per cent in north India.

(4) Participation in gainful employment: In terms of the primary occupation of the households with widows, a far higher percentage of households in south India (47 per cent) than in north India (24 per cent) reported wage labour as their primary occupation.[13]

It is plausible that these and related factors play a role in enabling widows in south India to lead a less deprived life than their north Indian sisters, and contribute to the particularly high mortality rates of north Indian widows, discussed above.

Property Rights

In his opening remarks to this session, N R Madhava Menon noted that the issue of property rights is exceedingly complex because the distribution of property rights is governed largely by customary law rather than by statutory law. In regard to statutory law, he noted that the British colonial government did not touch matrimonial or inheritance laws and that the Indian government has not been able to introduce a uniform civil code. However, the Indian government has been able to 'secularise' much of Hindu inheritance law: the implications for Hindu widows is that their inheritance rights have been extended from limited estate or use rights (until their death) to full estate or ownership rights. But, as Menon concluded, statutory laws cannot be easily enforced and customary law still prevails across most regions and social groups in India.

In her presentation on the practice of leviratic remarriage in colonial Haryana, Prem Chowdhry argued that customary law itself is subject to negotiation and interpretation. In regions or social groups where the demand for women's labour and fertility is high, such as among the peasant castes in Haryana in the colonial period, the remarriage of widows through levirate was encouraged as a means of controlling their productive labour as well as their fertility and their property (as non-remarried widows were granted use rights to their husband's share of land). In other regions and social groups, where the demand for women's labour or fertility is low, widow remarriage is prohibited. What is notable about customary law, according to Chowdhry, is not only the differences across regions and social groups at a particular point in time but also differences within regions and social groups across time. In fact, she argues, customary law or customs are constantly being "shaped, challenged and reshaped by patriarchy to fit the particular needs of a community" (1994:1).

In a study of the land rights of widows in two villages in Rajasthan, Shobha and Ramesh Nandwana found that 17 out of 57 widows had land registered in their own names in the record of rights register. Of these 17, two had the land registered in their individual names and 15 had the land registered jointly in the names of themselves and their sons. The two widows who had land registered in their individual name had no sons. The Nandwanas noted that even when land is registered in a widow's name, either individually or jointly, she is typically not allowed by her in-laws or sons to sell, mortgage, or transfer the land. The Nandwanas then described the land registration process in Rajasthan, noting why widows find it difficult to claim their land rights, and made several recommendations aimed at better protection of these rights (see Appendix).

Table 9: Marital Status and Labour Force Participation in Rural India, 1981

Age Group	Proportion of All Widows in Specified Age Group	Labour Force Participation Rates (Proportion of 'Main Workers' in the Total Female Population) (Percentage)		Proportion of Agricultural Labourers among Women who Participate in Labour Force (Percentage)	
		Married	Widowed	Married	Widowed
10-14	0.1	18	22	52	63
15-19	0.3	23	36	53	63
20-24	0.7	24	39	51	59
25-29	1.4	25	44	50	56
30-34	2.5	27	47	50	54
35-39	3.9	28	47	49	52
40-49	15.0	27	39	48	52
50-59	22.8	22	27	46	52
60+	53.3	13	10	44	48
All ages	100.0	25	22	50	51

Note: The average labour force participation rate of widows is lower than that of married women, even though the *age-specific* participation rates of widows are higher than those of married women in the same age group, because widows tend to be concentrated in the older age groups.

Source: Compiled from various *Census of India 1981* reports.

In their study of the property rights of widows in two villages in Muzzaffarpur district of Bihar, Seema Misra and Enakshi Thukral examined the perspectives of the widows themselves and of the revenue department officials in that area. Irrespective of their caste, all the widows interviewed declared that they were rightful heirs to their husband's share of land and defined their right ('huq') as use rights rather than ownership rights. However, whether the widows could actually exercise their use rights depended on a number of factors: the age of the widow, whether she had children, the sex and age of her children, the interests of the dead husband's lineage, and the position taken by the widow's parents or brothers. In brief, widows without children faced the most difficulty in exercising their rights, and widows with sons had the least difficulty. But the rights of widows with sons amount to guardianship over the land until their sons mature, and maintenance from the land after their sons mature. The local officials expressed knowledge of the provisions of statutory law (which guarantee full estate rights to widows and daughters) but tended, through their actions and decisions, to reinforce the local status quo or customary practice (which grants only limited rights to widows and few rights to daughters). Misra and Thukral concluded that local bureaucratic practice reinforces local customary practice to effectively deny widows and daughters their statutory right to full ownership over a share of their husband's or father's land.[14]

To illustrate the social risks and legal hurdles widows face when they try to secure their property rights, three sets of case studies were presented. Based on her experience as a social and political activist in Maharashtra, Neelam Ghore presented case studies of two widows who filed legal cases against their in-laws for depriving them of their right to their husband's share of ancestral land. In one case, the in-laws had physically beaten the defiant widow; in the other, they had tried to alienate the widow's son from his mother. Neelam Ghore then described the work of two Pune-based organisations, Krantikari Mahila Sanghatana and Stree Aadhar Kendra, which have helped widows seek legal council and police protection in their struggle to secure property rights and maintenance rights.

Drawing on her experience as a social activist and researcher, Bela Bhatia submitted two notes to the session on property rights. The first included three case studies of widow's property rights in practice. In each instance, the in-laws of the widow sought to deny the widow her rights to a share of her husband's ancestral land through physical intimidation or worse. In one instance, the widow was beaten. In another, the widow was doused with boiling water and her neck was cut. In the third instance, the widow was brutally murdered.

The second note addressed the issue of the land rights of widows under the resettlement and rehabilitation programme of the Sardar Sarovar project (also known as the Narmada Dam project). The rehabilitation package prescribes that a widow who has lost her husband before 1980 cannot be counted as a household head but must be considered as a dependent. This implies that such widows, even if they are registered land owners ('khatedars'), and even if they have no sons to support them, are not entitled to land or housing. In some cases, the sons of widows classified as dependents have been resettled in sites distant from their widowed mothers. In a few such cases, the sons resisted moving to resettlement sites until their widowed mothers were compensated, but were ignored by the resettlement officials. Bela Bhatia ended her analysis with a compelling question: how are displaced widows who are not compensated and who are separated from their sons (or have no sons) expected to survive?

As discussed by N R Madhava Menon in his concluding remarks to this session, many issues relating to the property rights of widows in rural India call for further investigation. Outstanding questions include the nature of property rights under customary law in different regions and among different social groups, the compromises that are made between customary law and statutory law, the conditions under which widows are able to claim their rights, the strategies used by others to deprive widows of their property rights, and the steps that can be taken to protect property rights. These are important issues for further research.

Social Security

The session on 'social security' included two types of presentations: some commented on various schemes to promote the social and economic security of widows; others analysed the causes of insecurity among widows.

In his opening presentation, S Guhan offered a useful framework for considering various social security measures for widows, differentiating among: poverty alleviation measures targeted at those widowed women who are also poor (e g, protection of property rights; allotment of land and housing; government employment; access to credit); survivor benefits for widows in general or for widows from poor households or specified occupational groups; life insurance; rehabilitation and training schemes; and pension schemes (for widows above 50 who have no adult sons). Guhan ended his opening comments with a rough calculation of what it would cost the government of India to provide a monthly pension of Rs 100 a month to 20 per cent of all widows above 50 and survivor benefits for deaths which occur in the income-earning age group (20-60 years): an annual bill of Rs 900 crore (including overheads), or 0.1 per cent of India's gross domestic product (GDP) of Rs 9,00,000 crore.

Iqbal and Leela Gulati discussed social support for widows under three pension schemes in Kerala: the Destitute Old and Widow's Pension Scheme, the Agricultural Worker's Pension Scheme, and the Special Pension Scheme for the Handicapped. Their analysis focused on the proportion of widows covered under these schemes, the adequacy of pension entitlements, and financing issues. According to their calculations, about "half the number of widows in poor households of Kerala are currently covered by the three pension schemes" [Gulati and Gulati 1994:3].[15] In regard to the amount received, the Gulatis calculated that the current pension entitlements enable a widow to obtain her rations from the public distribution system (which provides limited quantities of foodgrains, sugar, edible oil and kerosene at subsidised prices), with some cash left over. The pensions, therefore, represent a significant source of independent support for widows who live as dependents, but they do not enable a widow who heads a household to support others as well as herself. In regard to the financing of these three pension schemes in Kerala, the Gulatis calculated that if pension entitlements remain unchanged in real terms, the burden on the state exchequer in 2001 would be about 5 per cent of the total annual government expenditure. This proportion should not be considered too high, concluded the Gulatis, given that the state government will be spending four to five times as much on pensions to retired government employees,

Table 10: Per-Capita Expenditure by Household Size and Type–Rural India, 1986-87

Household Size	Per Capita Expenditure (Rs per month), by Household Type		
	Male-Headed	Female-Headed[a]	Widow-Headed
1	224	165	158
2	161	152	147
3-4	130	129	120[b]
5-6	113	112	na
7-10	104	104	na
10+	99	92	na
All Sizes	122	135	132

Notes: [a] Including all 'widow-headed' households.

whose number is less than one quarter of the number of beneficiaries (widows and others) covered by the three social security schemes under consideration.

Eswara Prasad discussed the implementation of the Destitute Widow's Pension Scheme in one district of Tamil Nadu. After noting that the coverage of widows under the scheme was uneven within the district (with two more developed and accessible talukas accounting for 50 per cent of the beneficiaries), Eswara Prasad described in telling detail the exacting and somewhat contradictory criteria which a widow has to meet in order to qualify for the scheme, and the intimidating and time-consuming bureaucratic hurdles that are involved in filing an application for a pension. As the author comments, in order to qualify for the scheme a widow "must be single; have no children; earn less than Rs 100 per month; be physically unfit to work; should not beg; should not own a house; etc" [Prasad 1994:10]. However, to get the pension a widow "must be capable of applying for a pension; willing to visit the taluka office several times and put up with apathy of the officials; must be extremely patient and wait for long periods till enquiries are completed at each stage; must be capable and willing to spend money out of pocket; and so on!" (1994: 10-11).

In contrast to the limited provisions and inefficient administration of most state pension schemes, Reema Nanavaty described a pilot comprehensive insurance scheme for women established in 1991 by the Self-Employed Women's Association (SEWA) in Gujarat. Known locally as the Karya Suraksha (Work Security), the scheme provides insurance against the death of a woman who joins the scheme (Rs 3,000), against the accidental death of a member's husband, against illnesses which require hospitalisation, and against damages to homes and tools or equipment (up to Rs 5,000). To be covered under the scheme, each member must pay an annual premium of Rs 45 (for annual coverage), or make a one-time payment of Rs 550 (for life-long coverage). To date, some 7,000 self-employed women have subscribed to the scheme.

After these presentations which focused exclusively on social security schemes for widows, Varsha Bhagat and Mihir Bhatt presented studies which included data on the insecurity of widows as well as observations on existing or potential social security schemes. Varsha Bhagat reported on a survey of 131 widows in four districts of Gujarat and on a 1993 convention ('sammelan') of some 450 widows, divorced and deserted women. The survey focused on widows from scheduled castes, landless families and other disadvantaged sections of the population. The vast majority (over 75 per cent) of the 131 widows surveyed lost their husband before the age of 45, are illiterate, work as wage labourers, and earn less than Rs 5,000 per year. However, only 18 were beneficiaries of the state government's scheme for rehabilitating destitute widows, deserted, or divorced women. In fact, a majority of the widows surveyed had at best a vague idea of the existence and terms of this scheme. After presenting case-studies of three widows which illustrate some of the limitations of family or community-based systems of social security, Varsha Bhagat talked about problems relating to the rehabilitation scheme for destitute women, including: lack of public awareness, narrow eligibility criteria, inadequacy of and discrepancies in the amount provided, unrealistic rehabilitation and training objectives, and problems in implementation. Many of these problems were quite similar to those reported by Eswara Prasad for Tamil Nadu. She concluded with a practical plan of action in support of destitute widows, to be taken up jointly by the state government and non-government organisations. This plan of action includes measures to address the basic survival needs of widows, and also to provide skills training, vocational training, and credit to widows (and their children), to provide legal aid to widows, to provide life and housing insurance, to develop a savings scheme for widows, and to offer residential housing and pensions to elderly destitute widows. Some of these measures have been incorporated in the participants' recommendations listed in Appendix I.

Mihir Bhatt's report on a 1993 survey of 148 widows in Banaskantha District (Gujarat), presented on his behalf by Reema Nanavaty, focused on the impact of both widowhood and drought on poor women. In

TABLE 11: INCIDENCE OF POVERTY ('HEAD-COUNT RATIO') BY HOUSEHOLD TYPE, FOR DIFFERENT LEVELS OF 'ECONOMIES OF SCALE' IN HOUSEHOLD CONSUMPTION

Type of Household	Mean PCE	Head-Count Ratios, for Different Values of the 'Economies of Scale' Parameter (k)		
		k=1.0	k=0.8	k=0.6
1 Male-headed	123	.57 (6)	.21 (2)	.04 (1)
2 Female-headed	135	.51 (3)	.23 (3)	.08 (3)
(a) Widow-headed	133	.53 (5)	.27 (4)	.10 (4)
i Living with others	128	.51 (3)	28 (5)	.12 (5)
ii Living alone	158	35 (1)	.35 (6)	.35 (6)
(b) Other female-headed	140	49 (2)	.17 (1)	.05 (2)
All households	124	.57	.21	.04

Note The numbers in brackets indicate the ranking of different household groups by head-count ratio, with '1' denoting the least poor group and '6' denoting the poorest group.

Source Special tabulation of the 42nd round of the National Sample Survey (1986-87) by P V Srinivasan (Indira Gandhi Institute of Development Research, Bombay). The 'head-count ratio' is the proportion of households with 'adjusted PCE' below a specified poverty line. 'Adjusted PCE' is defined as $x^* = X/n^k$, where X is total household expenditure, n is the household size, and k is the "economies of scale parameter" (thus, adjusted PCE is simply per-capita expenditure for k = 1, and total household expenditure for k = 0).

TABLE 12: MAJOR PENSION SCHEMES IN KERALA, 1991-92

Pension Scheme	Eligibility Conditions	Monthly Allowance	Expenditure Incurred (Rs crore)	Number of Pension Recipients (lakh)	Estimated No of Widows Among the Pensioners (lakh)
			91-92	91-92	91-92
Destitute and old widows	Age: above 65 for destitute elderly; no age limit for widowhood. Income: not to exceed Rs 100 per month. Family support: no relative above the age of 20.	Rs 65, plus Rs 5 for widows with one or more children	14.01	1.83	1.22
Agricultural workers	Age: above 65 years. Income: not to exceed Rs 1,500 per year (including income of unmarried children).	Rs 70	18.97	3.35	1.34
Physically and mentally handicapped	Disability: minimum 40 per cent as certified. Income: (i) family's annual income not to exceed Rs 5,000, and (ii) beneficiary's monthly income not to exceed Rs 75.	Rs 85	8.23	0.84	0.03

Source: Adapted from Gulati and Gulati (1994), Tables 1 and 2. The authors estimate the number of widows below the poverty line in Kerala was around five lakh in 1991-92.

line with the results of other empirical studies in north India. Bhatt found that only a small proportion of widows had remarried (in this case, two out of 148), although nearly half were widowed before the age of 40, and that more widows lived with their sons or on their own (46 per cent) than with their parents or own relatives (31 per cent) or with their parents-in-law or relatives of their deceased husband (20 per cent). In contrast with Marty Chen's findings, Mihir Bhatt found that the percentage of widows engaged in agricultural wage work dropped from 40 per cent before widowhood to 25 per cent at the time of the survey. Bhatt attributes this drop to local caste norms regarding women's work outside the home, especially alongside men: only one-third of the widows he surveyed reported that they could work alongside men; one-third reported that they could not work alongside men, and one-third reported that they could work alongside men only under certain conditions (most notably, that the men were from their own, not their husband's, family). Given these restrictions on their employment opportunities, widows who head households are often among the most affected when a drought occurs. Indeed, over 25 per cent (41) of the widows reported that they could not find enough work during the most recent drought to meet their consumption needs, four reported that they had to break caste norms to take up 'men's' work, two were forced to sell animals, and two were forced to sell land.[16]

Employment and Livelihood

The session on employment and livelihood explored two related issues, the relationship between widowhood and poverty, and the relationship between widowhood and employment. In connection with the first theme, Jackie Loh described the preliminary findings of an analysis of National Sample Survey data (1986-87) by P V Srinivasan, Jean Dreze, and herself (these findings have already been discussed in above). Leela Gulati then presented some longitudinal data on the relationship between widowhood and poverty in a slum area of Trivandrum, Kerala. She noted a relatively high incidence of widowhood in the low-income area: widows represent 9.1 per cent of the total female population in Kerala, but 13.6 per cent of the total female population in the study area. Leela Gulati also noted that all the widows in the study area are aware of the pension schemes but only 22 per cent are beneficiaries (compared to an estimated 40-50 per cent for the state as a whole), that not all sons can afford to support a widowed mother (casual labourers are least able to do so); that a majority of widows have to manage on their own, and that the needs of widows include not only economic security but also physical security, help with children's education, and self-respect.

These opening presentations on the relationship between widowhood and poverty were followed by five presentations on the relationship between widowhood and employment. D V Rukmini presented the results of a 1992 survey of 4,500 households in Haryana conducted by the National Council of Applied Economic Research (NCAER). This survey focused on households with at least one female member working outside the home. Rukmini reports that in the 15-59 age group, the labour force participation rate of widows is higher than that of married women among the scheduled castes and tribes, but lower than that of other women among the backward and upper castes. The labour force participation rate is also higher among widows than among married women in rural areas, but the reverse applies in urban areas.

Alice Thorner reported on a mid-1980s study of 523 working class women (from 357 households) in Bombay city, of which 86 were widows. Of the 86 widows, 32 were over 60 years of age, and only 19 of the remaining 54 were involved in gainful employment, eight in domestic services, seven in petty trade, two rolling 'bidis', and one reading the Koran to other women (another two were looking for work at the time of survey). What struck Thorner was the fact that out of 21 households which had no male earners, 12 were headed by widows. Also, unlike other working class women in the sample, the widows were not engaged in factory work, white-collar work, or construction work, and nor had they found work as sweepers, artisans, or caterers ('khanawalis').[17] These findings, highlighting the restricted nature of gainful employment opportunities for widows in urban areas, are consistent with the findings that have emerged from Marty Chen's study for rural areas (see above).

In its report entitled 'Shram Shakti', the National Commission on Self-Employed Women classified women's work into the following categories: unpaid family work; wage labour outside the home; contract work or piece-rate work at home, independent (or self-employed) work; and the exchange of goods and services in kind. Using this classification, Renana Jhabvala's paper (presented by Reema Nanavaty) explored the implications of widowhood for the work and income of each category of women workers. The worst affected, in her judgment, are often the unpaid family workers, as they often have no independent access to credit, skills, markets or alternative occupations (1994:6). However, the situation of women who work for wages outside the home can also be quite precarious, especially in the rural areas, as participation in wage labour often depends on being able to work alongside one's husband. In stone mining, for example, the adult male members of the family dig out and break the large stones while women break them into smaller pieces. A widow either has to give up such work or attach herself to the work team of another family where she gets paid only the lowest wages for breaking the stones. In household production, too, men often do certain tasks which women are not accustomed to doing for social or physical reasons: for example, men typically plough the land so that, when widowed, women often have to lease out their land. Even if the death of the husband does not affect the working conditions of the woman, a widow often has to work doubly hard and even take on new work to compensate for the loss of her husband's income. Jhabvala concluded with a description of SEWA's work and of how membership in such associations can serve to strengthen the employment, income, social standing, and individual confidence of women (including widows).

Drawing on her experience with a union of domestic workers in Madras, Siddama described two types of domestic work and how widows are exploited under each. Within their own families or their deceased husband's families, widows are often expected to work long hours at domestic chores (seen as the 'natural duty' of women, especially widows and destitute women), but are still considered as a 'burden' on the household. When they work as domestic workers in other people's homes, widows often work long hours at below-minimum wages with no medical benefits, child care support, or retirement benefits. Because domestic work in urban areas is often one of the few jobs available to women, and because most employers will not let women keep their children with them, many widows have to put their children into orphanages when they migrate to cities in search of work.

Based on similar involvement with a union of construction workers, Geetha Ramakrishnan described the situation of two widows who are construction labourers. Maniammal, now 75 years old, worked as a construction labourer from the age of 10 until she was 74. Although she was at the forefront of the construction labour movement, she receives no pension as a retired construction worker (as both the state and central governments have failed to respond to the construction workers' demands), and she had to fight with the revenue department for one year before she was granted a pension of Rs 75 per month as a destitute widow. Unable to survive from this pension alone, much less to repair the roof of her hut, Maniammal had to resort to begging. Savitri, a young widow, lives with two young children in a city slum. To supplement her earnings from construction work, her children have had to go to work and she has become a prostitute. As Geetha Ramakrishnan concluded, social

oppression and economic exploitation go hand in hand.

Social Reform and Collective Action

In her opening remarks, Shobha Raghuram, the chairperson for this session, noted that the previous sessions had provided a glimpse of only the "tip of the iceberg" and that the iceberg itself consisted of a complex set of issues relating to the image and identity of women in general (not only widows) in Indian society. Raghuram then laid out an agenda of issues for the session on social reform and collective action, including: the impact on widows of images and terms used to label them (what Raghuram referred to as "linguistic oppression"); the need to create opportunities for widows to come together and redefine their image (as women with dignity and rights); the need to create a "culture of resistance"; and the need, most critically, to initiate a public debate on whether widows need to be integrated into Indian society (as currently structured and defined) or whether Indian society itself needs to be "reformed".

In her presentation, which examined the cultural and ideological construction of widowhood, Uma Chakravarty explored two related questions: why widowhood in India is constructed as social death (that is, why widows are treated as having no social, individual or sexual identity) and why, despite a common underlying ideology, different castes treat widows in different ways. Uma Chakravarty summarised the underlying logic of why widows are expected to remain celibate and chaste and to lead ascetic lifestyles in this way: widows, especially young widows, are seen as sexually dangerous (as having the potential to disrupt, pollute, and discredit their dead husband's lineage and society at large) and must, therefore, be 'neutered' or unsexed. The defacing of widows is particularly marked among the upper castes, such as the havik brahmans in Karnataka, in which women have no socially valued role other than their reproductive role. Among the lower castes, such as the chuhras in Uttar Pradesh, in which women are valued for their productive as well as their reproductive role, widows are allowed to remarry and remain incorporated in the social and economic order. Chakravarty concluded that the patriarchal formulations of appropriate behaviour for widows of high castes and widows of low castes reflected, and were structurally integrated into, the ideology and material relations of the caste system: a system in which the upper castes could restrict their own reproduction in order to reduce pressure on the physical resources under their control while encouraging the lower castes to reproduce (albeit while castigating the sexual mores of the lower castes) in order to increase the human resources under their control.

Building on Chakravarty's analysis, Abha Bhatya offered a comparative perspective on widows and other single women based on an analysis of patriarchal control over women's sexuality, fertility, labour, and property and of patriarchal images and definitions of womanhood. According to Abha Bhaiya, the patriarchal ideology which underlies the identity and construction of womanhood is mitigated by class, caste, and ethnicity but, primarily, by marital status. The purpose of patriarchy is to control women through the institution of marriage. When her husband dies, a woman's identity and situation changes dramatically. Among the upper castes, where women are valued only for their reproductive role and where high fertility is not valued, widows have no legitimate identity. Among the lower castes, where women are valued for their productive role and fertility is more highly valued, widows are needed for their powers of production and reproduction. However, Bhatya argued, widowhood should not be allowed to overshadow the problems of women within marriage or the problems of other single women. All single women face common problems, including not being recognised as heads of their own households, being seen as available for domestic labour in the household in which they live, and having no social or cultural occasions on which to come together.

After this insightful discussion of patriarchal control by Chakravarty and Bhatya, the session turned to various efforts to socially (and economically) 'rehabilitate' widows. Ritu Menon presented the findings of a study she had undertaken with Kamla Bhasin on the role of the state in rehabilitating women who were widowed at the time of partition. Early state initiatives to rehabilitate partition widows, she argued, differ in some important respects from current efforts to organise various welfare schemes for widows and other destitute women. In particular, because the widows of 1947 were 'widowed by history', it was accepted that their well-being was the responsibility of the state, and also that they needed not just temporary relief but a means of supporting themselves for the rest of their lives. The critical difference, Menon argued, is that in the immediate aftermath of partition the rehabilitation of widows was considered a necessary part of social reconstruction. In contrast, the current provisions of social security for widows are considered "more akin to handing out dole, with all its demeaning implications" [Menon and Bhasin 1994:15].

Chandra Bhandari described the current efforts of a non-government organisation in Rajasthan, Seva Mandir, to organise and support rural women (including widows). In the course of their work, Seva Mandir members have come to recognise specific concerns of widows, including: attempts by in-laws to disinherit them (sometimes based on accusations of witchcraft); ban on remarriage among some castes; demand for bride-price upon remarriage in other castes; high costs of death ceremonies (particularly the 'mrityu bhoj' or death feast); bureaucratic hurdles in securing a pension; and lack of opportunities for vocational training. In response to these problems, Seva Mandir members have helped widows to remarry, obtain pensions, find jobs, fight legal battles over land, and, in one instance, they even helped a widow to defend herself against suspicions of witchcraft by socialising and eating with her.

Uma Kulkarni spoke about the current efforts of the Karnataka branch of a national women's programme, Mahila Samakhya, to organise and support rural women (including widows). In the course of organising women, the staff of Mahila Samakhya, Karnataka, have adopted several strategies to promote a more positive image of widows. In the early days of their organising work, widows used to withdraw when the oil lamps were lit during any ritual function. The Mahila Samakhya activists asked the other women to think about why widows felt compelled to withdraw and asked the widows to explain what they felt. Then, the activists began to ask widows to inaugurate meetings by lighting the oil lamps and to ask other women to garland and apply kumkum to widows (who are otherwise forbidden to wear flowers or 'kumkum'). Gradually, the self-esteem of the widowed members of Mahila Samakhya increased. Now, if men comment on the behaviour of widows at Mahila Samakhya meetings, the members of Mahila Samakhya confidently challenge them.

Bela Bhatia described recent efforts to organise widows in rural areas of Bhiloda taluka in north Gujarat, jointly led by two non-government organisations: Shramjivi Samaj, a local union of agricultural workers, and Setu (the Centre for Social Knowledge and Action, based in Ahmedabad). In 1988, women activists from Setu and Shramjivi Samaj organised a mass gathering (sammelan) of single women at the taluka headquarters in Bhiloda. This gathering was an opportunity for single women to come together, share their concerns and voice their demands to local government officials. More than 500 women participated, most of them widows. They agreed on a detailed list of demands, which included the effective implementation of pension schemes – until then virtually non-functional in Bhiloda taluka. After the sammelan, and acting on these demands, Shramjivi Samaj helped more than 300 widows as well as over 100 destitute elderly women to get pensions from the state government. Shramjivi Samaj also enabled widows and other single women to get ration cards in their own name, to get their name entered in the official list of persons below the poverty line, to get just and proper resettle-

ment (in the case of widowed oustees of the Guhai dam), to build links with other women's organisations in Gujarat, and even to contest gram panchayat elections. Despite their success in addressing some of the problems voiced by destitute single women, the women of Shramjivi Samaj and Setu recognise that many other problems remain unaddressed, including: the denial of land rights; the needs of the children of destitute single women; the persistence of child marriage in the area (which leads to widowhood even among female children); the continued influence of negative social attitudes towards widows; and the need for basic changes in the formulation of pension schemes. This experience in Bhiloda taluka, however, offers an encouraging example of the possibility of active mobilisation of widows and other single women in rural areas.

Public Action

In the closing session of the conference, a panel of representatives of the conference participants (one from each of the main sessions) presented a set of recommendations regarding future action, policy, and research in support of widows. A panel of representatives from the workshop (four widows and a local woman activist) also presented a charter of demands made by the widows themselves. These recommendations are presented in Appendix I. It should be made clear that not all conference participants agreed with all these recommendations. They are not presented here as a collective charter of demands, but rather as a set of possible directions of future action and research.

By way of conclusion, we would like to reiterate that the concerns of Indian widows cannot be dissociated from those of other single women, or indeed from those of women in general. Widows do experience special difficulties and deprivations, connected, *inter alia*, with the restrictions that are imposed on their lifestyle and the persistence of negative social attitudes towards them. In the context of social science research, it is right to give attention to widowhood as a particular cause of deprivation. And, in the context of social action, it is right to organise and support widows in their specific demands (e g, relating to pensions, property rights and other entitlements). But this does not mean that action has to take the form of working for or with widows in isolation from other women. As the studies and personal testimonies summarised in this paper amply demonstrate, there are intimate links between the predicament of Indian widows and a wide range of patriarchal institutions such as patrilineal inheritance, patrilocal residence and the gender division of labour. The cause of widows must be seen as an integral part of the broader battle against gender inequalities.

Appendix: Recommendations of Participants

In this appendix, we list the recommendations made by the workshop and conference participants. As explained in the concluding section of the paper, these recommendations should be interpreted as suggested directions of future research and action, rather than as collective demands agreed by all participants.

Recommendations of Conference Participants

Property Rights

Several participants recommended that all land should be registered jointly in the name of both husband and wife, but there was no general agreement on this recommendation. Other suggestions made by different participants included the following:

(1) The transfer of property should take place automatically and quickly after the death of the husband: that is, the widow's name should be automatically entered in the land records upon the death of the husband

(2) Further, if the husband's share of land is still held jointly with his father and/or brother(s), mutation and partition of the holding should take place simultaneously. The responsible tehsildar should be made responsible for ensuring that mutation and partition take place.

(3) The land registers or records need to be updated and routinely maintained in the light of these recommendations.

(4) Landless widows should be given priority when there is allocation of cultivable land by the government.

(5) Further, when land is allotted to married couples, it should be registered jointly in the name of both husband and wife.

(6) Modern legislation relating to the property rights of widows should be enforced.

(7) The Hindu Succession Act 1956 should be amended to revoke the provision according to which a man is allowed to will away his entire property.

(8) State tenancy laws need to be reviewed for specific biases against women in general and widows in particular

(9) Land reform acts need to be reviewed for specific biases against women in general and widows in particular.[18]

(10) The state should intervene in cases of bigamy (because only the first wife can file a suit against the husband) and of levirate (because enforced remarriage through levirate is one way of depriving a widow of her property rights).

(11) Awareness of modern law should be promoted, and women should be helped to enforce their legal inheritance rights.

(12) Research on the following issues should be undertaken:

– options available to women regarding inheritance and remarriage, and women's motivation in making a choice between various options;

– the working of the joint 'patta' system, where it has been introduced;

– customary practices, and how they interfere or interact with statutory law;

– the gap between the theory and practice of law, and how the divergence can be reduced;

– why women have internalised the notion of property rights as a male right;

– the tactics used by others to deprive widows of their inheritance rights, and the steps that widows can take to exercise these rights.

Social security

There was wide agreement among the conference participants that social security should be considered in a broad sense, to include education and health for all, and that the government of India should invest in developing social security systems as an important dimension of economic development. Some participants called for comprehensive social security schemes for widows. S Guhan offered a framework for viewing comprehensive social security for widows within the context of broader anti-poverty and pro-women policies: a gradation of measures that proceed from wider to narrower specificity. The various recommendations of the conference participants fit into that framework as follows:

(1) 'Anti-poverty measures', under which widows should be given preferential treatment: land redistribution; allotment of house sites and houses; health schemes; public distribution; employment guarantee and self-employment programmes; credit schemes.

(2) 'Pro-women measures', which would benefit widows as well as other women, e g female education, enforcement of laws relating to minimum age at marriage, and protection of women's property rights.

(3) 'Rehabilitation measures', targeted specifically at widows, such as vocational training, adult education, awareness camps, legal counselling, provision of assets for self-employment, residential housing for elderly widows.

(4) 'Social security measures', which are designed for and/or targeted to widows, including: survivor benefits (in the form of social assistance provided by the government, or subsidised life insurance extended to rural areas); calamity insurance (e g insurance of housing, land, animals, tools, trees and other productive assets); unemployment insurance (e g, unemployment compensation for working widows); pensions (monthly allowances for all widows, or for widows without adult sons); short-stay homes for widows.

There were a number of specific recommendations in regard to pensions:

(1) Pensions should be viewed as

entitlements, not as a dole.

(2) Pension entitlements should take the form of legal rights, enforceable in court, rather than of *ad hoc* transfers dependent on the good will of the state.

(3) Pensions should be given for life (rather than only for a few years, as currently applies in most states), and the monthly allowances should be raised.

(4) A decentralised and reliable delivery system for pensions should be developed.

(5) The central government should provide support to state governments and non-government agencies involved in the rehabilitation of widows or in providing social security benefits to widows.

(6) Consideration should be given to the case for universalising widow pensions (i e, giving pensions to all widows, rather than insisting on particular eligibility criteria), as a means of preventing the abuses and bureaucratic hurdles that inevitably arise when eligibility conditions are introduced.

Employment and Livelihood

In addition to the social security measures listed in the preceding section, the following recommendations emerged from the session on 'employment and livelihood':

(1) Labourers, including working women, must get a fair deal and participate in decision-making with government and employers. Women must have at least proportionate representation on tripartite boards.

(2) Jobs in the organised sector should be reserved for widows.

(3) Unemployment allowance, linked to the price index, should be provided to widows.

(4) Day care facilities should be provided in every economic sector and unit.

(5) Primary education should become compulsory and stipends should be provided for children's education.

(6) The perception of women as workers should be promoted, because ultimately every woman is a worker. The media, non-government organisations, and trade unions all need to ensure that the image of women (and widows) is changed.

Social Reform and Collective Action

The recommendations from the session on 'social reform and collective action' included the following:

(1) Women need an identity as autonomous individuals and as citizens of the country.

(2) Women require a time and space at the grass roots level to meet, organise, and unleash their own power for change

(3) The state should support rather than oppose women who act as agents of change, and protect them from repressive violence.

(4) Non-government organisations should be sensitised to examine the actions they are taking to support widows, their own role in perpetuating patriarchy.

(5) Existing schemes need to be redesigned to include mechanisms whereby women have better control over resources.

Demands of Workshop Participants

During the week-long discussions and exchanges among 35 widows from nine states, two issues became very clear: that all the widows voiced certain common demands, and that these demands covered basic material needs as well as the need for identity, dignity and respect. The demands put forward by widows during the last session of the conference included the following:

(1) Housing: including automatic transfer of the conjugal house to the widow's name upon the death of her husband, or allotment of house site and housing by the government.

(2) Land: including automatic transfer of land (and other property) to the widow's name upon the death of her husband.

(3) Jobs: including automatic transfer of husband's job to the widow (or her son) and training plus subsidies for self-employment

(4) Education for their children: including scholarships; stipends to cover the costs of books, uniforms, and transport; and boarding facilities.

Notes

1 These events were planned and co-ordinated by Marty Chen of the Harvard Institute for International Development. Important contributions to their organisation were made by several people, including Gita Sen and Bina Naidu of the Indian Institute of Management, Bangalore, which hosted both events; Abha Bhaiya and Shanti of Jagori and Lakshmi Krishnamurty of Alarippu, who helped plan and run the workshop.

2 See particularly Dreze (1990), Chen (1991b), Chen and Dreze (1992), Chen (forthcoming)

3 Mahila Samakhya is a national programme of "women's equality and empowerment through education", with branches in five states.

4 Parts of this section also draw on Dreze 1990, Chen 1991, Chen and Dreze 1992, and the literature cited in these studies.

5 Government of India 1993:71. The reference year is 1991.

6 The same trend of concurrent expansion of longevity affects the age distribution of widows, with widowhood becoming more and more concentrated in the older age groups. The relationship between widowhood and aging, which raises important issues of its own, is investigated in Leela Gulati's contribution to the conference (1994).

7 The fact that mortality rates are higher among widowed men and women than among their married counterparts should not be interpreted as definite indication of a causal link between widowhood or widowerhood and increased mortality. Other explanations can be advanced for the observed associations. For instance, if husband and wife are exposed to a similar epidemiological environment, the states of being widowed and having a relatively high risk of mortality may both reflect an unfavourable epidemiological environment (rather than a causal association between losing one's spouse and increased mortality).

8 For further discussion, see Dreze (1990) and Chen and Dreze (1992).

9 It is interesting to note that a very large proportion of widows who remarried (67 per cent) lost their second husband. This is likely to reflect the fact that a widow's second husband is often a man who is much older than her, or suffers from some illness or physical disability (see the discussion of "remarriage practices" further in this section).

10 In many parts of India, particularly in tribal communities, widows are sometimes killed as witches. The underlying motivation appears to be economic: the accusers and murderers are often male relatives, typically step-sons or brothers-in-law, who want to control her land. It is reported that in the Jharkhand region of Bihar, of 95 cases of Santhals killed by Santhals over a 30-year period, 46 were witch-killings; of which 42 were women, most of them widows with land [Kelkar and Nathan 1991]. See also Bhatia (1994b) for some case studies.

11 Another important aspect of the remarriage issue is the freedom to refuse forced remarriage, e.g. in the form of an ascribed leviratic union.

12 On north-south contrasts in kinship systems, and their implications for women, see Karve (1965), Sopher (1980), Miller (1981), Dyson and Moore (1983), Kishor (1993), among others: also Dreze and Sen (forthcoming), and the literature cited there.

13 It should be noted that much the same levels of wage labour participation obtained before widowhood as well

14 The practice of inheritance rights in rural Bihar, as reported in this study, is strikingly similar to the situation found by Jean Dreze in the village of Palanpur in western Uttar Pradesh (some aspects of inheritance practices in Palanpur are described in Dreze, 1990). In both contexts, the primary fact seems to be that a widow is regarded as having only use rights to her husband's land as guardian of her sons, until they grow up This seems to reflect the continued influence of customary law, with modern law being either ignored (if it is known at all) not only by the village community but also by local officials.

15 This compares very favourably with the coverage of eligible widows under the pension schemes for destitute widows in other states. In her sample, Chen found that 10 per cent of all widows and 23 per cent of widows without adult sons (an important criterion for eligibility in most states) actually received pensions. Interestingly, the proportion of widows who had received pensions was about twice as high among upper-caste widows as among scheduled-caste widows.

16 In her study of the 1985-87 drought in one village of Ahmedabad district in Gujarat, Chen (1991) found that no productive assets, other than trees, were mortgaged or sold. She attributes this to the effective presence of relief works, in which all castes except the brahmans, traders, and shepherds participated and in which more women than men participated.

17 From their analysis of a longitudinal data set (based on 1985 and 1992 surveys) of pavement-dwellers in Bombay city, Madhura Swaminathan and Tara Ramkumar (1994) found that the two households that suffered downward mobility were headed by widows, that a large number of the 'chronically poor' households (five out of eight) were headed by widows, and that the women in the sample participated in a narrow range of occupations and had limited opportunities for occupational mobility

18 For example, land ceiling acts should be applied only to earning members of a household so that a dependent widow (or woman) does not lose her only asset

Social Security for Widows

Experience in Kerala

I S Gulati
Leela Gulati

In practically all the states there have been in existence schemes addressing the destitute old and widows since the early 1960s. During the 1980s several states extended social security arrangements to physically and mentally handicapped persons and to agricultural workers. Kerala is one of these states. This paper discusses these schemes in Kerala from the standpoint of the social security they provide to widows in the state.

SOCIAL security pensions are basically intended to provide income support to persons adversely affected, by events like retrenchment, sickness, physical disability, old age and/or widowhood. In practically all the states of India, there has been in existence a scheme since early 1960s, addressing the destitute old and widows. The coverage of the scheme, in terms of the proportion of the population covered, differs from state to state principally because of the ceiling, on the maximum number to be covered, imposed explicitly or implicitly, by state governments out of financial considerations [Guhan 1990]

Lately, however, these quantitative ceilings have tended to be relaxed. In several states, they have been eliminated altogether, as is the case in Tamil Nadu and Kerala. Also, during the 1980s, several states have extended social security arrangements not only to physically and mentally handicapped persons but also to the workers in the major occupational group, namely, agricultural workers, who could easily be classified as being on the lowest rung of the income ladder. Kerala is one of these states. A separate scheme, Agricultural Workers' Pension Scheme, was introduced in Kerala in 1980. The scheme for the physically and mentally handicapped was introduced in the state in 1982.

In addition, quite a number (30 or so) of contributory pension and welfare funds catering to various occupational groups exist in Kerala, with a membership of over 10 lakh Also, as many as 2.6 lakh persons received unemployment assistance in 1991-92 [State Planning Board 1993].

Coverage of Pension Scheme

The coverage of three major social security pension schemes in Kerala, (1) Destitute Old and Widows Pension Scheme, (2) Agricultural Workers Pension Scheme, and (3) Special Pension Scheme for the Handicapped, amounted to 6 lakh persons (Table 1). This was the number of persons drawing one of the listed pensions in 1991-92 As a proportion of the total number of households in Kerala, the families drawing these pensions represented 12 per cent (i e, one in eight). The coverage of similar schemes taken together in Tamil Nadu worked out to 4-5 lakh in 1991-92 [Guhan 1990, Prasad 1994] which, as a proportion of the state's total number of households, worked out to 5 per cent In this sense, the coverage of welfare pensions in Kerala could be said to be more than twice as large as in Tamil Nadu.

Since to quality for pensions under these schemes, the persons concerned and their families have to fulfil the criterion of maximum income, it can safely be assumed that they all belong to families below the poverty line. The number of households below the poverty line works out to 16 lakh in Kerala going by the estimates of incidence of poverty by the Planning Commission's Expert Group (headed by D T Lakdawala). The total coverage of the three welfare pension schemes would work out to be 37.6 per cent. On the other hand, according to a recent house to house survey in the state organised in 1990 for the identification of families eligible for assistance under rural anti-poverty programmes, it was found that there were 17.86 lakh families below the poverty line in Kerala. On the assumption that three-fourths of the beneficiaries under the three pension schemes were rural based, the combined coverage of the three pension schemes can be said to extend to one-quarter (25.31 per cent) of the rural families below the poverty line in the state.

The question still remains whether the coverage by these pension schemes of even 37.6 per cent of the poor families can be considered adequate. If not, can an increase in coverage be considered realistically? To probe these questions it is necessary to look at the disaggregated information. We shall do so with respect to widows.

Coverage of Poor Widows

As can be seen from Table 1, the distribution of the pension recipients, separately under each of the three pension schemes was 1 82 lakh under the scheme for the destitute old and widows, 3.35 lakh under the scheme for agricultural workers and 84 5 thousand under the scheme for

Table 1 Major Pension Schemes in Kerala

Pension Scheme	Eligibility Conditions	Monthly Rate of Pension	Exp Incurred (Rs crore)			Number of Pension Recipients (in lakh)		
			90-91	91-92	92-93	90-91	91-92	92-93
(1) Destitute old and widows	*Age* Above 65 years for destitute old No age limit for widows *Income*: Not to exceed Rs 100 p m Family Support Should have no relatives above the age of 20.	Rs 65 plus Rs 5 for widows with one or more children	12 77	14 01	15 94	1 82	1 83	1.87
(2) Agricultural workers	*Age* Above 60 years *Income* Annual income of family (including income of un-married sons and daughters) not to exceed Rs 1,500	Rs 70	29 14	18 97	26 90	3 24	3.35	3.41
(3) Physically and mentally handicapped	*Disability*: Minimum 40 per cent as certified. *Income:* (i) Beneficiary's monthly income not to exceed Rs 75, and (ii) Family's annual income not to exceed Rs 5,000	Rs 85	8.75	8.23	8 9	0 76	0.84	0.90
Total			50 66	41 21	51 79	5.82	6.02	6 18

Source. *Economic Review*, 1991, 1992 and 1993, State Planning Board, Government of Kerala, 1992, 1993, 1994.

physically and mentally handicapped. It is not unlikely that there will be some overlap between these pension schemes in the sense that some old men or widows might qualify for pension under more than one scheme. But the schemes would not allow the same family to draw more than one pension, given the income or family support criteria. We hazard our estimate (Table 2) of the widows benefiting under the three schemes on the assumption that a widow draws pension under only one of the three schemes.

Of the 1.82 lakh recipients of pension as destitute old and widows in 1990-91, two-thirds (1.22 lakh) were widows. It is assumed that the same number of widows were drawing pension under this scheme in 1991-92 when the total number of pensioners was 1.83 lakh. The proportion of women receiving pension as agricultural workers, out of the total number of 3.35 lakh beneficiaries, was given out as 58 per cent for 1989-90, the only year for which such information is published in official documents [State Planning Board 1991]. Assuming that 69 per cent of the women receiving the pension for agricultural workers were widows (here the assumption is that the incidence of widowhood among women over 60 is the same among agricultural workers as in the state as a whole) the number of widows covered under this particular scheme in 1991-92 could have been 1.34 lakh. It should be added that while the qualifying minimum age under the destitute old and widows scheme is 65 years, for agricultural workers the qualifying age is 60. As for the possible number of widows among the handicapped pension recipients, we assume that all the beneficiaries of the scheme were women and of these female beneficiaries the proportion of widows is the same as in the state's total female population (9.1 per cent for 1981). The number we get by this method is 3.8 thousand. Thus the number of widows receiving pension support in Kerala would add up to 2.60 lakh.

This number has to be seen in the context of the existence of poverty in the state. Going by the estimate of the incidence of poverty in Kerala as worked out by the Planning Commission's expert group and given the overall incidence of widowhood per household in the state, the total number of widows in families below the poverty line should be around 4.5 lakh in 1991-92. With the number of widows in the state who were in receipt of pension support estimated by us at 2.6 lakh, the coverage of widows of poor families is obviously not total. The coverage of poor widows under the three pension schemes in the state works out to nearly 60 per cent (57.5 per cent). The coverage would however work out to be lower if one goes by the estimate of poor households recently reported [State Planning Board 1993] on the basis of a house to house survey. As stated already, according to this survey rural families below the poverty line were as many as 17.86 lakh. On this assumption that the incidence of widowhood per household is the same as for the state as a whole, the coverage of rural workers of the three pension schemes would work out to 40 per cent. It should be added that even this lower estimate of coverage is predicated on the important assumption that the number reported officially as beneficiaries under the three schemes are in actual receipt of the pension amount.

Inadequacy of Pension Amount

We turn now to the question of the adequacy or otherwise of the amount of income support extended through the three pension schemes discussed in this paper.

As can be seen from Table 1, the amount of pension admissible varies somewhat from scheme to scheme. For the destitute old and widows the monthly entitlement is Rs 65, for the agricultural workers it is Rs 70 and for the handicapped it is Rs 85. For the destitute widows an additional entitlement of Rs 5 per month exists for those with one or more minor children. If one were to compare the pension entitlement with the going wage rate in the state for unskilled workers (Table 3) the amount a pensioner draws is equivalent to less than two days' wages for men and two-and-half days' wages for women. For the handicapped pensioners the relative position is somewhat better, be they men or women. Still, judged by the criteria of the going wage rate for unskilled workers, the pension entitlements are grossly inadequate.

There is, however, another way of looking at the question of the adequacy of pensioners' entitlements, namely, the extent to which the pension amount can meet the basic food and other requirements of the pensioners. In Kerala state, the public distribution system is quite comprehensive in its coverage of not only the urban households but also the rural households [State Planning Board 1993]. Limited quantities of foodgrains, sugar, edible oil and kerosene are made available to holders of ration cards at controlled prices. Until recently, the controlled prices of foodgrains were considerably below those prevailing in the open market. The entitlement to foodgrains on the strength of ratio cards could be taken to meet almost all the calorific requirements of a non-working adult. Assuming that the average food requirements of an old person would thus be met, particularly when he or she is not engaged in much income-earning physical activity, the ration quantity could perhaps be

Table 2: Estimate of Widow Pensioners under Three Major Pension Schemes in Kerala State, 1991-92

Pension Schemes	Total No of Pensioners (1991-92 in lakh)	Estimated Number of Widow Pensioners (in lakh)	Remarks/ Assumptions
Destitute old and widows	1 83	1.22	Estimated on the assumption that the proportion of widows is the same as in 1990-91, i e, 68 per cent.
Agricultural workers	3 35	1.34	Calculated on the assumption that (1) The proportion of women drawing the pension is 58 per cent as in 1989-90, and (2) 69 per cent of these women were widows.
Physically and mentally handicapped	0.84	0.04	The assumption is that (1) half the number of pensioners under this scheme consists of women, and (2) 9.1 per cent of the women pensioners were widows, the same proportion as applied to the total female population.
Total	6.02	2.60

1991-92	41.38	26.30	39.71	41.63	31.64	34.32

Source: Economic Review 1992, State Planning Board, Government of Kerala, 1993.

not that inadequate for an old pensioner as could be the case for a working adult.

This, however, could not be valid for a young widow pensioner and much less so when she has one or more minor children to take care of, though her pension amount is enough to buy her own ration quantity. Young widows with children tend to be in the labour force doing work that is extremely demanding physically like working on construction sites, as brick loaders or doing earth work and their calorific requirement is much higher.

In terms of adequacy, even for old pensioners, the underlying assumptions has to be that he or she is living with his/her family so that his or her other needs including his accommodation are taken care of. In such cases where a pensioner is living with his/her family, his/her pension entitlement, however small, makes him/her less a burden and thus enhances his/her acceptability among his/her family members and neighbours.

It ought to be added that if the pension amount remains fixed, but the issue prices of the items distributed through the public distribution system keep rising, the real value of pension entitlement naturally declines. In Kerala, the last upward revision in pension entitlement was made in 1991 when the pension entitlement for the agricultural workers was raised from Rs 60 to Rs 70 per month. On the other hand, the issue prices have been raised more than once ever since and the increase in the issue prices of foodgrains in Kerala in the course of the past three years has been in the range of 57 per cent to 75 per cent.

Financing of Pensions

All the three pension schemes discussed above are financed out of the state government's budget. No financial assistance is received for the purpose from the central government.

The total amount paid out as pension under these schemes was Rs 41.21 crore in 1991-92 (this figure, however, was rather low compared to the figure of Rs 50.66 crore for 1990-91 and Rs 51.79 crore for 1992-93) which as a proportion of the total state government expenditure in that year worked out to only 1.2 per cent (for 1992-93 the proportion works out to the same, taking into account the higher outgo of Rs 51.79 crore since the total government expenditure had also registered a corresponding increase). As a proportion of the state domestic product (SDP) the amount paid out under the three welfare pension schemes comprised around 0.3 per cent.

It should be added here that the state government's expenditure on service pensions (the pension paid to retired government employees), whose number in 1991-92 was about 2 lakhs, was as high as Rs 230 crore. Thus the average service pension worked out to 13 times the average payment to beneficiaries of the above mentioned welfare pensions.

On the assumption that (1) the criteria for eligibility under the three pension schemes was so liberalised as to include all widows, young and old, in the families below the poverty line, and (2) the pension amount was raised to Rs 100 per month, the total coverage under all the three schemes taken together would have increased from 6 lakh to 8.5 lakh and the total expenditure involved on pensions would have amounted to Rs 102 crore. Still, the expenditure on these pensions would have worked out to 0.75 per cent of SDP and 3.4 per cent of the total expenditure during 1991-92 of the state government.

Projections for the future show that the proportion of the aged (60 +) in the state's total population will go up from the present 7.55 per cent in 1981 to 10.2 per cent in 2001 [Gulati 1992]. Naturally, therefore, there will be an increase, proportionally greater than the state's total population, in the number of persons entitled to pension under the schemes addressing the aged, among whom the percentage of widows is found, at present, to be quite large. Assuming that incidence of poverty (as measured by the proportion below the poverty line) remains unchanged, there is bound to be some increase in the proportion of the state government expenditure necessary to be allocated for payment of social security pensions at the rates now prevailing, but the increase is unlikely to be more than marginal, from 1.2 per cent in 1991-92 to 1.6 per cent in 2001. The assumption being made is that the total government expenditure increases only as per the trend witnessed over the recent years.

If it were decided to liberalise the aforesaid pension schemes on the lines suggested above, with the entitlement kept in real terms, the burden on the state exchequer in 2001 will certainly be higher. It will be in the vicinity of 5 per cent of the total annual government expenditure, a proportion that cannot be regarded high considering that the state government will be spending 4-5 times as much on service pensions payable to just about one-quarter of the number of beneficiaries covered under the social security pensions. The arguments of financial constraint against liberalising the social security pension schemes and extending them to all poor widows obviously do not hold much water. It should be added that these arguments are equally, if not more, applicable to the other states of India, some of whom are financially much better placed than Kerala and still all of them lag considerably behind Kerala in regard to social security measures.

Need versus Supply of Drugs

Anant R Phadke

It is not primarily inadequate expenditure on drugs that is responsible for the unmet drug needs of the people, but the use of irrational and unnecessary drugs and the irrational use of rational drugs. A study of drug expenditure in Satara district of Maharashtra bears this out.

IT is often pointed out that the per capita drug consumption in a developing country like India is quite low as compared to that in the developed countries. The drug companies want drug consumption in India to increase from the current estimated Rs 7,000 crore to Rs 15,000 crore by the year 2000 AD. But this estimate is not derived from any study of the actual needs of the Indian people based on the prevalent rates of all the diseases in India. We therefore decided to make such a need-based estimate of drug requirement for Satara district (Maharashtra) as an example. We are unaware of any study which has estimated the drug needs at district level or above in a systematic manner on the basis of estimated morbidity load.

Satara district was selected for the following reasons. We took into consideration its socio-economic development, size of the civil hospital (number and beds), existence of cottage hospitals, expenditure on drugs and logistic convenience for undertaking a study there. The Centre for Monitoring Indian Economy's Index for district socio-economic development was taken to classify districts in Maharashtra as highly developed, averagely developed and underdeveloped. The districts falling in the averagely developed class were selected for application of other criteria. From the Performance Budget of the Government of Maharashtra 1990-91, information on the sanctioned beds in the civil hospital and expenditure for drugs were obtained for the averagely developed districts. Before doing the final selection, the logistical convenience to study the district from Pune city where our research staff was located was kept in mind. Satara district in the western part of Maharashtra fulfilled the above criteria better than other districts. Table 1 shows its characteristics. We carried out this exercise of estimating drug needs of Satara district in two stages. We first estimated the drug needs for curative/symptomatic care if the patients coming to PHC-OPD were to be treated rationally and adequately. This need was compared with the average drug supply to PHCs for curative/symptomatic care during 1991-92 in Satara district.

In the second stage of our exercise, we estimated the drug needs for Satara district, if all the patients in Satara district were to be adequately and rationally treated and if all children and mothers in Satara district were to be given adequate preventive medication in a maternal and child health (MCH) programme. This need was compared with the total sale of drugs of Rs 21.28 crore during 1991-92 in Satara district.

The first step in this exercise was to calculate the number of ill persons who come to PHC-OPD for medical relief. This was done as follows.

In the first phase of the study, drug supply data of nine PHCs (out of 69) were collected. Out of these nine PHCs, we wanted to select six PHCs for this study; two each from average, backward and developed areas. But only two out of these nine were in the averagely developed area and one of them, the Bawdhan PHC, had a very low OPD attendance. One PHC from backward area was selected to replace the Bawdhan PHC. The Pimpode PHC from developed area was also excluded due to low OPD turn-out and the Aundh-PHC from backward area was dropped because of very poor records in that PHC. The final selection was as follows: PHCs from backward area - Khatav, Mayani, Vaduz, PHCs from average area - Bhuinj; and PHCs from developed area - Indoli, Undale.

The average annual OPD attendance in these PHCs in Satara district is 7,774. To get a minimum average sample of more than 100 cases, an approximate 5 per cent sample was taken, i e, every 20th case-paper from the case-papers of 1991-92 was selected, starting from a random number. The condition for which treatment was sought during the last visit as noted on the case-paper along with the age of the patient was noted down by the pharmacist-investigator. Analysis of these data gave us the estimated disease-wise frequency of patients coming to PHC-OPD. Since overall aim of this exercise was to estimate drug-needs of this morbidity load, the patients were grouped into three age-groups - 0-5 years, 6 to 12 years and above 12 years. In order to calculate the cost of an adequate and rational drug treatment for all the cases coming to PHC-OPD, standard prescriptions were prepared on the basis of Indian medical text books, with the help of concerned experts for the 92 common conditions encountered in these prescriptions. Then the costs of drug treatment for these 92 common conditions were worked out on the basis of rate contract prices.

The detailed standard drug treatment cost estimates for each type of disease reported at each of the six PHCs selected for study were worked out. Table 2 gives the summary of these results. Table 3 gives the details of this exercise for one PHC (Bhuinj) by way of example. (Table 3 contains, by way of example, only the first five and the last five items from the original table.) This estimate excludes cost of drug-therapy for TB and leprosy because the PHC-OPD routine case paper records do not contain a record of TB and leprosy patients. These records are kept separately.

Table 2 shows that the average drug requirement for curative/symptomatic care for patients seeking treatment at PHC-OPD during 1991-92 was Rs 67,418 per PHC for these six PHCs; Rs 11.68 per patient. As mentioned earlier, we have not included here the drug cost for treatment of tuberculosis and leprosy. But this small deficiency would not materially affect the argument given below about the drug needs of patients coming to PHC-OPD.

We have also worked out as an example the requirement of different important, commonly used drugs for Bhuinj PHC and have compared this with the actual supply to Bhuinj PHC during 1991-92. The categorywise (as per categories of Essential Drug List of WHO) requirement and supply for Bhuinj PHC has been given in Table 4. This table illustrates in a very concrete way the categorywise shortfalls and imbalances in the supply of drugs to a PHC. (Table 4 contains by way of example the first four and last four items from the original table.)

Shortfall at PHC

Let us compare the need of Rs 67,418 per PHC for drugs for curative/symptomatic care with the drug supply to these six PHCs as worked out in the first part of the larger

Table 1. Criteria for Selection of District

	Maharashtra Average	Satara
The CMIE index (All India = 100)	163	93
Average no of beds in non-teaching Civil Hospital-Ch (1990-91)	239	235
Average OPD attendance per day (CHs) (1990-91)	631	350
Average daily expenditure on drugs per OPD patient (Civil Hospital) (1990-91) (Rs)	4.47	7
Average no of Indoor Patients per day (CHs) (1990-91)	251	233
Average daily expenditure on drugs per Indoor patient (CHs) (1990-91) (Rs)	22	20
Distance from Pune kms	-	70

study, for the year 1991-92. It was an average of Rs 37,134.38 per PHC. We have excluded the supply of anti-tubercular drugs for these six PHCs, since the estimate of the need excluded anti-tubercular drugs. These supply data are based on drug supply to PHCs from all sources. (PHCs do not get only Rs 15,000 to Rs 20,000 as mentioned in the Annual Report 1991-92 of the Zilla Parishad; more drug supply comes under various schemes.) Thus there is a shortfall of Rs 30,284 per PHC.

This shortfall must be met by additional supply. The average recurring expense per PHC during 1991-92 as given in the 1991-92 Annual Report of Satara Zilla Parishad was Rs 0.363 million. The additional drug supply required would be only 8.34 per cent of this expenditure. Today PHCs do not cater adequately to the felt needs of the people for curative/symptomatic care. If this is done by a mere 8.34 per cent increase in the PHC budget for recurring expenses, an important acutely felt need of especially those poor people in rural area who seek medical care at PHCs would be fulfilled. Secondly, it would increase the esteem for the public health system and thereby increase people's co-operation in public health programmes.

Increased drug supply to PHCs would need a change in the overall official attitude and policy towards health care. It is true that prevention is better than cure. But it does not mean neglect of ailments which are already there. The official policy conveniently makes precisely this mistake of neglect of curative/ symptomatic needs of the people, leaving it to the private sector. This attitude must change. A government which collects huge taxes and does not spend even a minimum 5 per cent of GNP (as per recommendations of the Health For All Strategy of the Alma Ata Conference) has no right to ask people to go to private practitioners for their curative/symptomatic needs. At least primary health care needs must be necessarily met.

The need of Rs 67,418 per PHC per year as calculated above is only a small part of the total drug needs of all the people in Satara district. This is because only a small proportion of patients go to the PHC. The rest go to private practitioners. The drug needs for curative/symptomatic care of the total population has been worked out in Table 5. For this we needed community-based morbidity data. In India community-based morbidity data for some diseases have been recorded. But to our knowledge comprehensive morbidity data for all major and common diseases in India are not available. However, some estimates of overall morbidity load in India are available [Park 1987, Duggal 1994]. We used these estimates in Table 5 for Satara district, since these data for Satara district are not available. The morbidity rate for this average district is unlikely to be quite different from the all-India average. It will be seen from this table that drug requirement for OPD level curative/ symptomatic care (excluding TB and leprosy) for the total population in Satara district is in the range of Rs 92.97 to Rs 208.96 million with an average of Rs 151.02 million. To this is to be added the cost of treating all cases of TB and leprosy.

In calculating the cost of adequate and rational treatment for all the cases coming to PHC-OPD, we had deleted the cost of drug therapy for TB and leprosy, since the data for the same were not available in the PHC-OPD routine case paper records. But in estimating the total drug needs for Satara district for OPD level curative/symptomatic care, we have to add the cost of drug therapy for these two diseases for all patients in Satara district. To estimate this cost, we need prevalent rate of TB and leprosy in Satara district. No such data are available. We therefore used the prevalent rate of 2 per cent for TB as found in various surveys in India [Park 1990.132] and a prevalent rate of 6.37 cases of leprosy per thousand population in Maharashtra state. The agewise break-up of the Satara population (0-5 years, 5-12 years,

above 12 years) is required to calculate cost per case for these age groups. But such a break-up for Satara district is not available. We therefore used the data for India, since such demographic data do not vary much within India. For cost calculations, we used the cost of treating these diseases as worked out in our main study.

It will be seen from Table 6 that if all cases of tuberculosis and leprosy in Satara district were to be adequately and rationally treated, in 1991-92 it would cost Rs 27.31 million and Rs 2.42 million respectively, i e, a total of Rs 29.73 million. Thus the total drug cost of treating all OPD level cases (including TB and leprosy) in Satara district in a rational and adequate manner in 1991-92 would be Rs 151.02 m + Rs 29.73 m = Rs 180.75 m.

To this is to be added the drug cost of indoor cases. As per the performance budget of government of Maharashtra for 1993-94, the drug cost of indoor cases in the civil hospital and in the Karad cottage hospital was Rs 1.37 million and Rs 0.25 million, respectively, i e, a total of Rs 1.62 million. These two hospitals account for most of the indoor cases in the public sector. The number of indoor cases in the private sector is not 10 times that in the public sector as in the case of outdoor cases. But let us make a liberal assumption that the number of indoor cases in private sector is 10 times that in the public sector and hence the expenses for private indoor cases would be Rs 16.2 million; and the total for both the sectors together would be Rs 17.82 million. To this is to be added the cost of preventive medication.

Drug Cost MCH Programme

The next step in estimating the total drug needs of Satara district is to estimate the drug needs for prevention. Preventive medication is mostly immunisation of children and women and giving iron-calcium tablets to pregnant women. Thus, it means that all children and pregnant women are covered in the maternal and child health programme. To get the cost of preventive medication for all children and pregnant women, we first worked out the cost of immunisation per child for primary and secondary immunisation and the cost of drugs for ante-natal care per pregnant woman. This cost multiplied by the total number of children and pregnant women in need of preventive medication gave us the cost of comprehensive preventive medication for the maternal and child health programme.

The cost of this preventive medication has been estimated for Satara district in Tables 7 and 8. In this calculation we have assumed that all children would be covered by immunisation, whereas only 85 per cent coverage is adequate for herd-immunity. But on the other hand, we have not made any allowance for wastages. The extra 15 per cent vaccine that we have taken would take care of the wastages during transport and administration, etc.

NS - Not Supplied

To calculate the total number of children and pregnant women in need of preventive medication, we needed agewise break-up of the Satara district population. But this break-up is not available. We therefore used the figures for Maharashtra state. For this purpose, instead of the census data, we used the more reliable data and estimate of a recent study [Balsubramanyam et al 1994].

It will be seen from Table 8 that the cost of this comprehensive preventive medication for the maternal and child health (MCH) programme in Satara district is only Rs 6.86 million.

The total drug needs of Satara district in 1991-92 would thus be as in Table A.

TABLE A

(In Rs million)

For curative care at OPD level excluding TB and Leprosy	151.02
For all cases of TB and Leprosy	29.73
For preventive medication in MCH programme	6 86
For indoor cases	17 82
Total	205.43

TOTAL DRUG NEEDS VERSUS SUPPLY

The total drug sale in 1992-93 in Satara district from reliable sources (audited accounts of drug distributors) was Rs 26.6 crore. We estimate that the drug sale in 1991-92 would be 20 per cent less, i e, Rs 21.28 crore. Add to it the drug supply of Rs 5.6 million to the public sector, thus yielding a total drug supply of Rs 21.84 crore. Compared to this, the total drug requirement as seen above for OPD level curative/symptomatic care and preventive care as well as for indoor care in 1991-92 was Rs 20.61 crore. Thus the drug expenditure in Satara district in 1991-92 was adequate to take care of all the drug needs of the total population of Satara district. As is well known, a substantial part of the money spent by patients on medicines is wasted due to irrational prescriptions. We have estimated such wastages in Satara district as part of our larger study. We found that in a random sample of 152 prescriptions from 30 clinics, in the private and public sector respectively, 54 per cent and 69 per cent of the money spent on drugs was a waste. If this wastage is eliminated, the current drug expenditure in Satara district would be sufficient to cater to all the drug needs of the people in the district. It may be pointed out that while estimating drug needs for various diseases, we have assumed that drugs are given in sufficient quantity for adequate duration.

Based on limited data for a year from six PHCs in Satara district, we cannot draw general conclusions. But the estimate from the current study in Satara district of the total drug needs may be compared with the actual experience of the Munnar project. This project caters to all the OPD level and indoor level curative and preventive medical needs of a well demarcated population of 1,00,000 in tea estates in Kerala. It has been reported that the annual per capita recurring health expenditure in this project was Rs 120 out of which 25 per cent i e. Rs 30 was spent on drugs [Cherian 1993]. In our study, the total drug need for Satara district for 1991-92 was Rs 205 million, for a population of 2.45 million, i e, Rs 84 per capita. Thus we have not underestimated the drug need for Satara district.

DRUG NEEDS FOR INDIA

This drug need of Rs 84 per capita, if projected to the Indian population of 84.6 crore in 1991, works out to be Rs 7,106 crore. If we compare this need with the estimated production of drug formulations in India of Rs 6,900 crore in 1993-94 [Banerjee 1994], we find that the present level of drug production in India would roughly meet all the drug needs of the Indian people for rational and adequate medication. In any case, the argument of the drug industry to increase the present drug production to Rs 15,000 crore by 2000 A D is clearly untenable.

Our estimation of drug needs for OPD level care is an underestimate. This is because, (1) Our estimation of morbidity load is based on *reported* morbidity. This does not include morbidities like gynaecological infections

TABLE 5 ANNUAL DRUG REQUIREMENT OF SATARA DISTRICT FOR CURATIVE/SYMPTOMATIC CARE AT PHC-OPD LEVEL, 1991-92

	Estimated Rate of Morbidity Load ***	Annual Morbidity for Satara District (Popn 2.45m)	Drug Requirement Per Case (as per Table G-1) in Rs	Total Drug Requirement for Satara District in Rs million
Estimate - I*	3.25 illness episodes/ capita/year	3.25 x 2.45 = 7 96 million	11 68	92 97
Estimate - II**	2 per cent morbidity per day	$\frac{2 \times 365 \times 2.45}{100}$ = 17 89 million	11 68	208.96
Average		12.93 million	11.68	151 02

* Based on Park (10th edition). We have taken the average of the range given by Park of 2 6 to 3.9 illness episodes per capita per year.

** Duggal 1994 .

*** Since the estimate of rate of morbidity load for Satara district is not available, we have used the available estimated rate of morbidity for India

TABLE 6: ESTIMATED COST OF TREATMENT OF ALL TB AND LEPROSY CASES IN SATARA DISTRICT, 1991-92

Age-Group (Per Cent of Population in that Age-group) (A)	No of People in that Age-Group in Satara District (Million) (B)	No of TB Patients in that Age-group (Thousands) (C)	Cost Per Case (Rs) (D)	Total Cost (Rs Million) (E)	No of Leprosy Patients in that Age-group (F)	Cost Per Case (G)	Total Cost (Rs Million) (H)
0-5 years (15 per cent)	0.368	7.35	235.2	1 73	2344	60 58	0.142
5-12 years (22 per cent)	0.539	10.80	352 8	3.80	3433	90 88	0.312
Above 12 years (63 per cent)	1.544	30.90	705.6	21.78	9835	181.75	1.788
Total (100 per cent)	2.451	49 05	—	27 31	15612	—	2.42

Notes: A: Estimated from Park 1990; p 266, Table 6 Since demographic data required for this table are not available for Satara district, we have used available rates for Maharashtra/India, for this table.

B: Satara district population in 1991–2.45 million.

C: Estimated prevalence rate of 2 per cent (Park 1990, p 132, Table 2)

D and G: As per our column in Annexure I of our main study, [Phadke 1995]. Please see item nos 56 and 62 respectively in Annexure I.

F: Estimated prevalence rate of 6.37 per thousand population (Park 1990; p 211, Table 1).

TABLE 7: COST OF PRIMARY IMMUNISATION PER CHILD (1992 PRICES)

Type of Vaccine	Cost Per Dose	No of Doses	Cost (Rs)
BCG	NA	1	—
Oral Polio Vaccine	1.88	5	9 40
DPT (Triple) Vaccine	1.07	3	3.21
Measles Vaccine	4.43	1	4.43
Total			17.04

Note. Except for the measles vaccine, the costs of vaccines have been taken from the 1992 price-list of the Haffkine Bio-Pharmaceutical Corporation (Bombay), the public sector undertaking, which supplies vaccines to the Maharashtra government. Measles vaccine is not supplied by Haffkine and hence for measles vaccine, price as given in IPG 1991-92 has been used Prices for biggest available vial have been used as they are used in mass-vaccination Price of BCG vaccine is not available since it is supplied by the central government

which are generally not reported. (ii) Our estimate of Rs 11.68 of drug cost per case is based on PHC-morbidity data which generally do not adequately represent chronic diseases like diabetes, hypertension, etc. Despite this underestimation, we feel that the estimate of the drug industry of Rs 15,000 crore (more than Rs 150 per capita) for the year 2000 A D is too high

Financial Wastage

It may be pointed out here that though the current level of production of drugs would roughly meet the rational drug needs of the Indian population, today the majority of the Indian people are deprived of proper drug treatment because of poverty and paucity of medical services in the rural area. The drug industry focuses on selling drugs mainly to the middle and upper classes. They are lured into or cheated into (i) consuming drugs of doubtful or no scientific value (so-called digestive, appetite stimulants, brain tonics or sex tonics, etc); (ii) unnecessary consumption of rational drugs (multivitamin preparations in well-nourished patients or antibiotics in viral infections) (iii) Consumption of irrational combination of two to five drugs when only one of the constituents is adequate. Addition of other unnecessary ingredients merely increases the price of the drug (cough and cold mixtures, iron tonics, pain-killer drug combinations, etc), and (iv) buying well advertised brands when good quality, cheaper alternatives are available

All this is possible because the drug policy allows manufacture of all kinds of irrational drugs or irrational drug combinations and majority of doctors prescribe these either due to ignorance or social insensitivity or plain bribery from the drug industry in the form of samples, gifts or sometimes even direct financial incentives

Every study that has analysed a particular type of drug combination (anti-diarrhoea, multivitamins, iron tonics, over the counter drugs, etc) has found that almost all the drug combinations studied were irrational (seven to 11). A lot of money is wasted due to the undesirable, wasteful forms of drug consumption mentioned above (use of useless, unnecessary and irrational drugs). We have estimated this wastage in the Satara district study. For this purpose, we chose a systematic random sample of 68 and 84 prescriptions from a stratified, purposive sample of 19 and 30 private and public outdoor clinics respectively, from the three socio-economic zones of the district. The drug cost of these prescriptions calculated at retail prices, minus the drug cost of 'standard prescriptions' gave us the financial wastage due to these prescriptions. It was found that 69 per cent and 55 per cent of the money spent on these 68 private and 84 public prescriptions was a waste, with an average of 64 per cent [Phadke 1995.66]. This wastage affects not only the well-to-do, but also the poor.

This wastage of Rs 4.76 and Rs 2.08 per prescription in public and private sector respectively was projected to the Satara district morbidity data with the help of public sector outdoor clinic attendance data for Satara district and estimated number of illness episodes during 1991-92 (as estimated in Table 5. This exercise led to an estimation of wastage of Rs 17.70 crore on irrationalities in prescriptions in Satara district in 1991-92 [Phadke 1995.67]. Compare this with the drug supply of Rs 21.84 crore to Satara district as estimated above. It will be thus seen that though the existing drug supply to Satara district in 1991-92 was roughly adequate to cater to the rational drug needs of the district, most of this drug expenditure was wasted due to irrationalities in prescriptions.

Conclusion

On the basis of the exercise carried out above, we conclude that:

(i) The rational drug requirement at PHC-OPD level for curative/symptomatic care can be met in Satara district by increasing the health budget for recurring expenses by about 8.4 per cent and stopping the wastage of money through irrational prescriptions.

(ii) The total drug needs of Satara district inclusive of rational treatment of all outdoor and indoor patients and inclusive of total coverage in MCH programme would be Rs 20.54 crore in 1991-92.

(iii) Most of the drug expenditure in Satara district is wasted due to irrationalities in prescriptions.

If the money presently being spent on drugs in Satara district is not wasted on irrational and unnecessary drugs and irrational use of rational drugs and instead if it were spent on rational drug treatment, the current drug expenditure of Rs 21.84 crore is more than adequate to take care of all OPD and indoor cases as well as for preventive care. Thus, today, it is not primarily lack of drug expenditure that is responsible for the unmet drug needs of people in Satara district, but its irrational use.

Table 8 Estimated Cost of Preventive Medication in Satara District 1991-92

Type of Preventive Medication	Population in This Category in Satara District: As Per Cent of Population of Satara District	Population in This Category in Satara District: Absolute Nos in Millions in Satara District (Pop 2.45 million)	Cost Per Person in (Rs)	Total Cost in million (Rs)
Primary immunisation for all children up to 1 year	2.4	0588	17.04*	1.00
One booster dose each, of polio, triple and measles vaccine for all children between 1 to 2 years	2.4	0588	7.38	0.43
One booster dose each of polio and DT vaccine for all children between 5-6 years of age	2.5	0613	2.76	0.17
Two doses of typhoid vaccine for all children of 2-3 years of age	2.4	0588	1.24	0.07
Iron Calcium supplementation and tetanus immunisation for all pregnant women	3.0	0735	70.58**	5.19
Total		2663		6.86

Note * As per Table 7.

** As per the cost of Standard Drugs Treatment Regimen, worked this study, in Annexure A-I of the main study

[This study is part of our larger study, 'A Study of Supply and Use of Pharmaceuticals in Satara District'. This is a modified version of Chapter XI of my forthcoming book, *Drug Supply and Use under the Microscope* based on our three-year FRCH study of Supply and Use of Pharmaceuticals in Satara District. I am thankful to N H Antia for his encouragement, research associates Audrey Fernandes and L Sharda for their sincere work, the medical officers in PHCs in this study for their co-operation and Sham Ashtekar for comments on an earlier draft. We are thankful to Sanjeevani Mulay for drawing our attention to their study.]

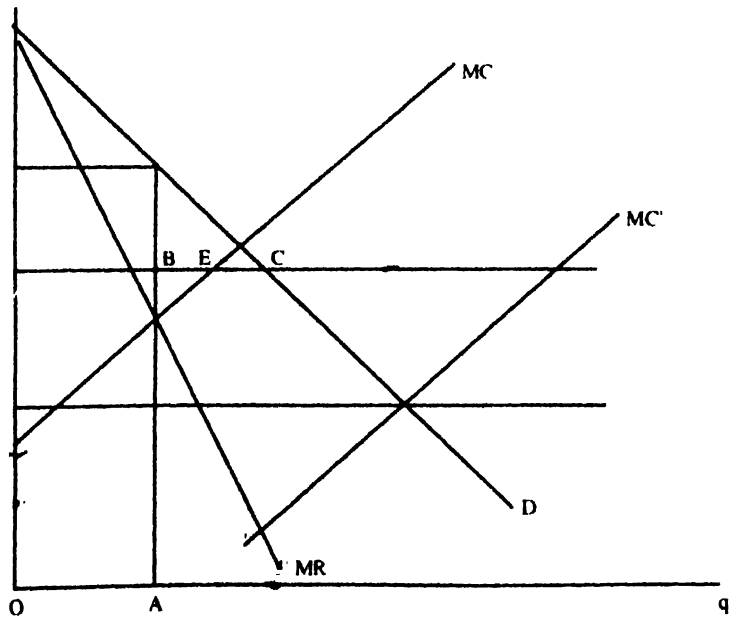
Protection and Exports

Soumyen Sikdar

DOES trade liberalisation give a boost to exports? On this question which is of considerable importance in the current Indian context professional opinion seems to be divided. Bose (1993) gives an affirmative answer. Since an import-substituting regime artificially bolsters the profitability of domestic sales, lower import tariffs would encourage exports by reducing the gap between the marginal revenues in the two markets. Marjit and Sarkar (1995) henceforth MS) question this and on the basis of a simple micro-economic model of price discrimination claim that a lower tariff will reduce the level of exports. Thus they obtain the unexpected result that higher tariffs may serve as a strategy for promoting exports. Given their basic framework the logic is nassailable, although the highly partial ature of the analysis should make one wary f drawing policy conclusions. The purpose f this note is to state some reasons that make ie feel uneasy about the framework and iggest a few modifications. The odifications which are not unrealistic have lverse implications for the main result.



In the discriminating monopolist imework used by MS (and also Bose) sale the foreign market is a residual. There ems to be some evidence that Indian exports : of this nature (see the literature cited in S). This is taken as a justification for the imework. But the same model has also other major feature, viz, given cost nditions, the output of the firm will be ermined solely by the parametric foreign ce. To my knowledge there is no evidence how that output decisions of Indian export ustries are critically influenced by world :es and largely independent of domestic nand conditions. This should encourage search for alternative models to explain alleged residual nature of our exports. 'il a better one is found the discriminating hopolist approach will continue to be d. It should be mentioned at this point the econometric method used by some hors to study Indian exports is far from nd. This, as pointed out by MS, renders ir results suspect.

the analysis of MS reduction in tariff no effect on the volume of imports, ich remains zero throughout. The tariff acts purely as a ceiling-setter on home price. This assumption of invariant imports is unrealistic in a discussion of liberalisation. The authors are aware of this and claim that it can be relaxed without upsetting the conclusion. But that requires a different and more sophisticated model. The discriminating monopoly approach is unable to handle it. Nevertheless it remains a fact that protected industries do feel threatened seriously by a prospective reduction in protection which, by encouraging imports, will reduce their command over the domestic market. There should be room in any analysis for this perceived threat on the part of protected firms because their reaction to policy changes will be conditioned by it. We think that this can be accommodated simply by interpreting the domestic demand curve facing the producer as his subjective or *perceived* demand curve Lower protection and the resultant *possibility* of greater foreign competition adversely affects the firm's estimate of attainable home sales and perceived demand shrinks. Whether in equilibrium imports will actually increase or not is irrelevant to this purely psychological impact. Business psychology matters for business decisions even in ordinary times, it becomes much more decisive when an entire regime is being overhauled. The implication for our analysis is that if the demand curve shifts inwards simultaneously with a reduction in tariff the MS result need not hold Home sales may well shrink and exports go up.

We have some comments to make with regard to the cost side too. Prolonged protection has serious distortionary effects on cost structures. Industries habitually fall asleep under protective umbrellas and tend to lose the urge to shed excess fat. Firms can afford to become careless about cost. With impunity workers and managers can choose to enhance their real income through extra leisure and lower pace of work. This sort of flabbiness was termed X-inefficiency by Leibenstein. Owing to this factor it is not surprising for the degree of protection and export performance to be inversely related. In such a situation exposure to competition acts as what Harold Macmillan once described as a 'bracing cold shower'. Preoccupied with purely allocational gains, orthodox analysis has largely chosen to ignore this particular source of social efficiency. Pelkmans (1984) is an exception, but MS is not.

Although no precise quantification is available, nobody can fail to notice even on casual observation the harmful and pervasive presence of X-inefficiency in India. A major hope of the advocates of liberalisation is that increased competition will bring an end to this Indian firms will get to learn the reality of hard budget constraints and be forced to operate on their true cost curves. There will also be learning through interaction with smarter rivals. Moreover, with the proposed reduction in bureaucratic control and rationalisation of rules and procedures there will be less corruption, uncertainty and delay. In short, the whole environment of business is expected to change for the better. The impact on efficiency is likely to be substantial. The positive externality may take some time to come into full force, but then no evaluation of a major regime-change should be done within a very short time frame. Once we

FIGURE

allow cost curves to shift down it is clear that (even with the demand curve unmoved) contrary to MS expansion in exports may accompany a reduction in tariffs. In their exercise total output remains the same even after the fall in tariff, so that the expansion of domestic sales is necessarily at the cost of (residual) exports. Under efficiency improvement total production expands and the conflict disappears.

What the liberalisers are hoping for may be illustrated with a simple diagram (see the figure). The world price is $\bar{P}$. Initially tariff is so high that the firm enjoys a position of sheltered monopoly and the equilibrium price and quantity are P_1 and OA. There is no import or export. Cost is so high relative to $\bar{P}$ that export is not possible. Now suppose tariff is lowered that $P_2 = (1+t)\ \bar{P} < P_1$. Equilibrium shifts to E with domestic sales expanding by BE and imports rising from zero to EC. Still there are no exports. Profit is of course lower. This reduction in domestic profitability induces the firm to take an interest in exports. Given $\bar{P}$, the only option is through a reduction in costs. If X-inefficiency can be eliminated and other cost-saving measures introduced, cost will fall and ultimately a stage may be reached (shown as MC') when the firm can enter the export market successfully on its own.

It cannot be overemphasised that unless efficiency improves on a sustained basis not much can be expected from the whole programme of liberalisation. Of the two possible sources of cost reduction – cheaper imported inputs and a rise in productivity – the latter is more important for attaining and maintaining international competitiveness because not all exportable activities are import-intensive and even the tariff-free prices of our essential imports are likely to show an upward trend over time.

Displacement and Rehabilitation

Walter Fernandes

I AM writing this in reply to Jai Sen's remarks in the Discussion section (*EPW*, April 29) on behalf of 12 participants in the National Workshop on the Rehabilitation Policy held in New Delhi in February. The 12 include the three members of the drafting committee.

(1) Commenting on the sections of his article in *EPW* (February 4) which have been deleted, Sen has given reasons why they should have been retained. This is good academic discussion. Unfortunately, after that he goes beyond it to what appear to be personal attacks. This is not called for in a serious discussion. Difference of opinion on issues has to be discussed in a spirit of dialogue, not in a polemical tone.

(2) The New Delhi workshop came after a democratic process. The democratic spirit continued during the meeting. Jai Sen says that this workshop was the "first formal occasion for the two schools to meet" (i e, his own thinking on displacement and rehabilitation and what he attributes to the rest of us whom he calls the mainstream). Though he claims that Smitu Kothari, co-convener of the National Working Group (NWG) and myself only acknowledge rehabilitation as a right of DPs and that he (Sen) alone has gone beyond it to question displacement, many participants felt that the difference was mainly in words. He wanted a displacement policy which some thought was like renaming life insurance as death insurance. Many of his views were accepted but not all. There was a consensus that we should go beyond these words to make displacement difficult. A three-member drafting committee chosen democratically put together the consensus that emerged in the form of a response of the participants to the draft rehabilitation policy. This response clearly states that displacement cannot be taken for granted and that the main task of a policy should be to minimise displacement. It questions the very rationale of displacement. For example, the second limitation the participants identified in the draft rehabilitation policy was:

> A national policy must enunciate the development paradigm within which minimisation of displacement is an essential prerequisite. But the draft policy is based on the development model that takes displacement for granted and as inevitable.

(3) Sen seemed to be satisfied with this. After receiving the response he wrote to me on March 7:

> (i) I was glad to see the mention, and by implication acceptance, of the idea of a 'national *displacement* policy' but (ii) unless I have missed it, I don't think that it has been anywhere clearly and in so many words said that the meeting *decided* that it is a displacement policy that is needed – it is only implied. This leaves the meeting's resolution and direction rather unclear.

By the time it reaches *EPW*, it has become a consensus of the meeting, but 'fuzzy or blurred'. Besides, I am not aware of any such 'decision', but only of a consensus.

(4) I was the convener of the national workshop but not a member of the drafting committee. The draft it prepared was discussed during the final session and I was asked to edit it. I did that without changing its contents. In the covering letter with which I sent them the response I informed the participants about it. So Sen cannot attribute the fact that all his views were not accepted to me or anyone else. But he says:

> it can only be said to be 'unfortunate' that the statement of conclusions subsequently circulated by the convener of the meeting, though giving a hint of this consensus, avoids completely spelling it out as such: and as a whole it is fuzzy and blurred in what it says. Perhaps this is inevitable, when two schools meet but where one is the convener.

(5) The claim that the NWG document and I only speak about rehabilitation without questioning displacement is surprising. Beginning from its introduction (No 4) several times the NWG draft states the need to avoid large-scale displacement and mentions that the policy is to be had when displacement is unavoidable.

(6) In *EPW* Sen does not say where he got the impression that I too speak only about rehabilitation. In the critique prepared for the Delhi workshop he had referred to the critique of the draft rehabilitation policy I had prepared with Samyadip Chatterji. It has now been published in *Lokayan Bulletin*, March-April 1995, pp 29-40. In that we fault the draft policy at least six times (pp 29, 34, 35, 37 and twice on p 38) for taking displacement for granted though it recognises the need to rehabilitate those who pay the price of development. We continue: "it can be argued that displacement itself is an offshoot of the present pattern of development. Thus, the thinking behind ... has to be questioned" (p 29). Our conclusion begins with "A rehabilitation policy cannot accept displacement as inevitable" (p 3[illegible]). Based on this we mention the need for non-displacing alternatives (p 32). Only in this context is rehabilitation as a right brought up as one of the basic issues (p 33). So we fail to understand how Sen can attribute this view to me and say that the Delhi workshop was a discussion between this mainstream and his (Sen's) view.

(7) More than its contents, the tone of Sen's discussion sounds over-bearing. One is left with the impression that an idea has to be accepted because it comes from him. The credibility of those who disagree with him has, therefore, to be questioned. A tone of dialogue is missing. Genuine progress can be made only through dialogue and not with such a pontificating tone which can only divide a movement.
